April 2010

Abstract

We conduct an update of the ranking of economic journals by Kalaitzidakis, Mamuneas and Stengos (2003). However, our present study differs methodologically from that earlier study in an important dimension. We use a rolling window of years between 2003 and 2008, for each year counting the number of citations of articles published in the previous ten years. This allows us to obtain a smoother longer view of the evolution of rankings in the period under consideration and avoid the inherent randomness that may exist at any particular year. Using this framework we proceed to examine the relative ranking of the Canadian Journal of Economics over time. We find the Canadian Journal managed not only to maintain its relative position, but to also improve it over time.

*We like to thank Maria Ioannidou and Charalampos Karagiannakis for excellent research assistance. Partial financial support from the Canadian Economic Association is gratefully acknowledged.

1 Introduction

There has been an important professional tradition within economics to rank journals and the literature on the subject has grown considerably in the past twenty years. Some important papers in the literature include Liebowitz and Palmer (1984) , Laband and Piette (1994), Kalaitzidakis, Mamuneas and Stengos (2003), Palacio-Huerta and Volij (2004), Liner and Amin (2006), Kodrzycki and Yu (2006), Kóczy and Strobel (2007) and Ritzberger (2008). Journal rankings have been used as tools to evaluate the research performance of economics departments. They act as important signals for attracting new faculty and retaining older ones in highly ranked institutions and also attracting the best graduate students with academic aspirations.

An important argument in favor of journal rankings is the vast proliferation of new journals which makes the need for an objective comparison of the different research outlets imperative. It is the attempt to "objectify" scientific quality that makes the rankings exercises worth while as they foster the development of scientific standards and provide an indicator of scientific quality for those not only inside but also outside the profession. The objective premise on which rankings are based is that one paper cites the results that were obtained in another as these results were presumably important in the development of the arguments advanced in the current paper. It is the understanding that papers in a given field will quote the relevant literature in that field and any omissions are going to be attributed to random errors. Also, it is the case that certain pieces of work become such classics that there is no need to refer to the original source and they are simply referred to by name, e.g. the Solow-Swan growth model or Nash equilibrium. For the rest though, the assumption is that quality of a particular piece of work is captured in general by the citations that it generates.

In this paper we develop new journal rankings that are an updated version of the earlier work of Kalaitzidakis, Mamuneas and Stengos (2003). We use the same source of data from the Journal of Citation Reports (*JCR*) for the same category *economics* using the same iterative eigenfactor methodology and

corrections to arrive at the current rankings. However, the present study differs methodologically from that earlier study in an important dimension. We use a rolling window of years between 2003 and 2008 to conduct our analysis, for each year counting the number of citations of articles published in the previous ten years. For example, in 2008 we count the number of times articles published in 2008 cited articles published in the ten year period, 2008 to 1999. Similarly for 2003, we count the times articles published in 2003 cited articles published in the ten year period, 2003 to 1994 and similarly for all the in between years. This allows us to obtain a smoother longer view of the evolution of rankings in the period under consideration and avoid the inherent randomness that may exist at any particular year due to the given set of journals used in the analysis of that year. Over time, there is a proliferation of new journals and in our analysis in 2008 there are 209 journals, whereas in 2003 only 169. Overtime, the effect of such differences in size of the set of journals is smoothed out and it becomes less of an issue.

We further proceed to examine the relative performance of the Canadian Journal of Economics (*CJE*) over this period. The *CJE* is the official journal of the Canadian Economics Association and it appears in its current form since 1968. In earlier rankings, the *CJE* was ranked fairly high, see for example Liebowitz and Palmer (1984), where it was ranked just outside the top quartile group of journals (28th out of 108 journals), but it slipped to about the median in subsequent rankings, see Laband and Piette (1994), where it fell to the 62nd position out of 130 journals. However, it recovered to nearly the top quartile in Kalaitzidakis et al (2003), (42nd position out of a set of 159). In this paper, we find that the above relative improvement was not an aberration and that over the 2003 to 2008 period the *CJE* has not only maintained but also improved its relative position in the top quartile group of economic journals.

The paper is organized as follows. The next section provides the methodology that we employ to arrive at the new journal rankings. We provide details of the way that we arrive at these rankings and the data sources that are used. In the subsequent section we discuss the results. Finally we conclude.

2 Methodology

2.1 Journal Rankings

Below we outline in more detail the methodology we have employed in arriving at a more representative and accurate journal ranking.

The data source that we use to count the number of citations received by economic journals is the (*JCR*). For each year between 2003 and 2008 each article published in a given journal cites articles that have been published in the *preceding ten* years in other journals. All these citations are counted and provide the basis for the ranking analysis. In order to be consistent with Kalaitzidakis, Mamuneas and Stengos (2003) we only use the category *economics* in (*JCR*). That implies that we exclude journals that are core journals in other related disciplines, such as the *Journal of Finance*. However, the *Journal of Financial Economics* is included in this category.

In order to correct for self-citations and the age of a journal we exclude self-citations and all the citations of articles published outside the ten year horizon period that is used for each year of the analysis. Self-citations are excluded, since they bias the rankings (due to the common tendency of journals to cite their own articles more often). Similarly, given the establishment of many new journals in the last twenty years by ignoring citations older than ten years, we place more or less all journals on an equal footing, since older journals tend to accumulate more citations. We also correct for size of journal, as "bigger" journals that tend to publish more articles, also attract more citations, and most importantly for "impact" as citations are adjusted for the impact that the most influential journals have on the profession. To correct for the impact of the journal we have broadly followed the eigenfactor methodology of Liebowitz and Palmer (1984), see also Laband and Piette, 1994 and Kalaitzidakis, Mamuneas and Stengos (2003). This methodology is based on an iterative procedure which we briefly outline below.

Let C_{ij} be the number of citations to journal i from journal j , n the number

of journals in our list and Z_i a factor adjusting for the size of a journal . The t iteration is given by

$$I_{i,t} = \frac{\sum_{j=1}^n C_{ij}}{Z_i} I_{j,t-1},$$

where

$$I_{i,0} = \frac{\sum_{j=1}^n C_{ij}}{Z_i}$$

This process usually converges after a number of iterations, usually not more than 10 to 15 iterations The results reported in the tables have used no more than on 50 iterations in each case. Below we will discuss the results of these rankings.

3 Journal Rankings and the Relative ranking of the CJE

In Table 1, we present the impact adjusted journal rankings based on the above procedure and the corrections for self-citations and age of journal, both with and without adjustment for journal size for the final year of our analysis, 2008. In previous studies, journal size was adjusted using the total number of characters published per year, calculated as the number of characters per page times the average number of pages published. However, in this paper we correct for size by using citations per article. This is a more appropriate measure, since citations are attributed to articles irrespective of their size. The second column in Table 1 presents the impact adjusted but size unadjusted rankings, while the third column presents the impact and size adjusted rankings, using citations per article to adjust for size. *JCR* provides information for the number of articles per journal for most of the journals that make up the set of journals in the economics category of *JCR* in each of the years for the 2003 to 2008 period. We have standardized the top journal, *American Economic Review* to be equal to 100. The following observations are worth making. There are a number of new journals that have made their mark very quickly since their appearance in the profession. For example the *Journal of the European Economics Association* is

ranked 19th, the *Review of Economic Dynamics* is 24th and the *Journal of Economic Growth* is 26th. These journals are fairly new and they were not ranked in the Kalaitzidakis et al (2003) study. Other journals not ranked in that study such as *Econometric Reviews* and *Empirical Economics* are now ranked better than the median, in the 68th and 89th position respectively. The median in this case is *Energy Economics* as it ranks 105th out of 209 journals. Among the top journals it is worth noting the substantial relative improvements of the *Journal of International Economics*, the *Journal of Public Economics* and the *Economic Journal*.

Table 2 presents all the relative impact and size adjusted rankings for all the years between 2003 and 2008. Note that the total number of journals differs between the different years as there are new entrants all the time. In fact the *Journal of the European Economics Association* only entered the rankings in 2007 as it made its inaugural appearance in 2003. It is quite remarkable that it has attained just a high ranking position within such a short time. It is interesting to see that the high relative ranking of newer journals such as the *Review of Economic Dynamics* and the *Journal of Economic Growth* has been fairly stable in the top tier throughout the period. The list of top 30 to 40 journals that comprises the average list of the top twenty percent of journals over the period has remained also fairly stable with the exception of 2005 where there have been some fluctuations. The top journal over the period is the *American Economic Review* coming first in all years except in 2003, with the *Quarterly Journal of Economics* coming overall second and the *Journal of Political Economy*, *Econometrica* and the *Review of Economic Studies* taking the other three spots in the top five.

In Table 1, the *CJE* is ranked 40th out of 209 journals, whereas in the Kalaitzidakis, Mamuneas and Stengos (2003) study it was ranked 42nd out of a group of 159. In Table 2, we can see that its relative position has remained relatively stable in the top quartile group, except for 2005 when its ranking fell to the top thirty percent from the top twenty percent group in the previous year, taking the 54th position out of 175. However, overall the mean geometric rank of

the *CJE* places either in or very close to the top twenty percent of journals. This overall ranking shows a marked improvement, especially when seen in a historical context. Recall, that the *CJE* was ranked in the Liebowitz and Palmer (1984) study as just outside the top quartile (28th out of 108 journals), then it slipped to about the median in the Laband and Piette (1994) ranking, where it fell to the 62nd position out of 130 journals. It did recover to nearly the top quartile in Kalaitzidakis, Mamuneas and Stengos (2003), reaching the 42nd position out of a set of 159. The results for the 2003 to 2008 period suggest that the improvement found in the Kalaitzidakis, Mamuneas and Stengos (2003) ranking has not just been maintained, but also improved upon. Figure 1, displays the relative quantile position of the *CJE* over the period 2003-2008 and it appears, that apart from the year 2005, the steady state position is in the top twenty percentile. The fact that we have used a rolling window of years between 2003 and 2008, for each year counting the number of citations of articles published in the previous ten years renders the present study robust to short run fluctuations that may arise. We are able to obtain a smoother longer view of the evolution of rankings in the period under consideration and avoid the inherent randomness that may exist at any particular year, even though using the rolling window methodology does not totally preclude the presence of outliers as it has been seen by the 2005 year rankings that differ from the rest. However, the methodology adopted here allows us to be more confident about the robustness of our results. This suggests that having solidified a ranking in the top twenty percent of journals, the *CJE* can now aim at emulating the strong performance of the top generalist journals that make part of the top ten percentile of journals. Perhaps, the success of the *Journal of the European Economic Association* which achieved a rapid climb in the rankings ladder, even though it only started in 2003 can act as an example to follow.

4 Conclusion

We have conducted an update of the ranking of economic journals over the period 2003 to 2008 to that obtained by Kalaitzidakis, Mamuneas and Stengos (2003). Our present study differs methodologically from that earlier study in an important dimension. We use a rolling window of years between 2003 and 2008, for each year counting the number of citations of articles published in the previous ten years. This allows us to obtain a smoother longer view of the evolution of rankings in the period under consideration and avoid the inherent randomness that may exist at any particular year. Using this framework we proceed to examine the relative ranking of the Canadian Journal of Economics over time. We find the Canadian Journal not only to maintain its relative position, but to also improve it over time.
