Introduction

Ontario Agri-Food Innovation Alliance

The Ontario Agri-Food Innovation Alliance (is also known as OMAFRA-UofG Agreement) is a collaboration between the Ontario Ministry of Agriculture, Food and Rural Affairs (OMAFRA) and the University of Guelph (UofG). Through the Alliance, OMAFRA and UofG work together to advance impactful research and innovation that contributes to the success of the province's agri-food sector and promotes rural economic development.

Alliance programming supports the intellectual capacity, infrastructure and networks that produce, synthesize, transfer, and invest in world-class research, innovation, laboratory testing and veterinary capacity.

The Ministry's desired outcomes for the Alliance programming are:

1. Strengthen Indigenization, equity, diversity, and inclusion principles within Alliance programming.
2. Transparency and public confidence in the agri-food sector through the protection of public, animal and plant health, the environment, and Ontario's economy.
3. The tools and ability to respond to emergencies quickly and effectively within its agri-food sector.
4. An effective research and innovation system to achieve assurance in food safety, to protect animal, plant and public health and the environment, to grow Ontario's capacity to produce food, and to support a globally and domestically competitive agri-food sector.
5. Development of future skilled capacity to be ready for employment opportunities offered by the agri-food sector and rural Ontario, including highly qualified veterinary capacity in place to meet Ontario's needs.
6. Growth of third-party investment in agri-food and rural research, innovation and development, and data focused initiatives.
7. Increased sharing and access to data to facilitate new agri-food and rural research and data analytics to inform government decision-making.

Beyond these overall outcomes for the Alliance, the ministry is also increasingly leveraging "One Health" principles to support a holistic and multi-disciplinary approach to protecting food safety, animal health and welfare, stewardship, and protection objectives. The broader benefits of multi-disciplinary collaborations with a wider range of partners and governments are important for addressing persistent and complex challenges within the agri-food sector.

The Research Program is a main component of the Ontario Agri-Food Innovation Alliance Agreement and provides funds for research projects that support the following strategic outcomes:

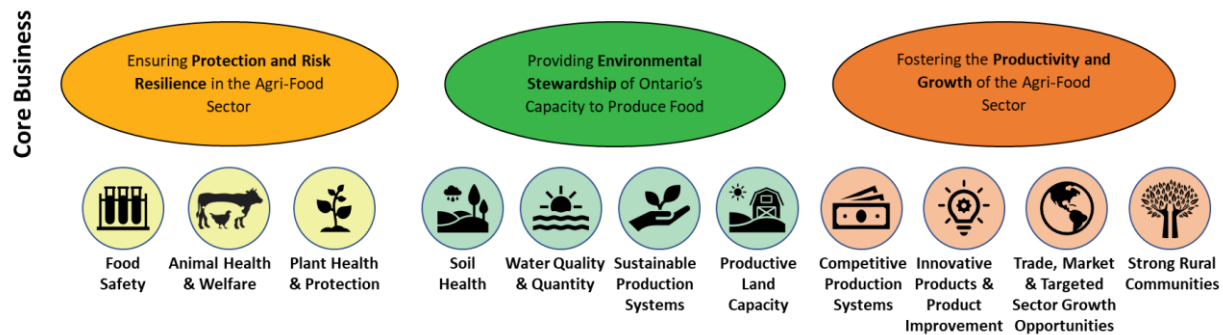

- achieving assurance in food safety
- protecting animal, plant and public health and the environment
- growing Ontario's capacity to produce food
- supporting a globally and domestically competitive agri-food sector

The University of Guelph administers the Alliance Research Program and makes recommendations on funding awards to OMAFRA.

[Full details on the Alliance agreement can be found here.](#)

Overview: OMAFRA Research Priorities

The purpose of this document is to outline OMAFRA's research priorities that will be used to solicit and evaluate proposals received through the Alliance Research Program's 2023-2024 call for proposals. Research priority setting aligns research priorities with the Ministry's core businesses and objectives: Protection and Risk Resilience, Environmental Stewardship and Productivity and Growth.

There are eleven high-level research priority areas and each of these research priority areas has a set of goals and a few research focus areas. Specific research questions under each focus area for the 2023-24 Alliance Research Program together with the research knowledge gap and desired outcomes of the research are identified in the [Appendix](#) to this document.

The applicants must clearly demonstrate that their proposal is within scope of OMAFRA's research priorities and fits with **one** (1) of the research questions in the Appendix. The research questions are reviewed and updated (if needed) each year to reflect agri-food stakeholder needs and new questions are added as appropriate. RIB IDs begin with the year that the

question first came into the list and as such, new questions for the 2023-24 Tier 1 research call will start with 2023.xxx.

Proposals that involve the development of a product or service must include a Value Assessment Plan. Information about this will be included in the application. There are eleven (11) specific research questions identified in the Appendix require a Value Assessment Plan.

Applicants are encouraged to use the *find* function to search keywords to identify all potentially relevant research questions that apply to areas of research interest. The focus areas under the priority areas below are linked to tables in the Appendix to allow easier navigation throughout the document.

PROTECTION AND RISK RESILIENCE

Ensuring Protection and Risk Resilience in the Agri-Food Sector

Food Safety

Goals

- Enhance public confidence in the sector to deliver on food safety, animal health, plant health, emergency management, and animal welfare expectations and demands.
- Anticipate, detect, mitigate and/or reduce food safety hazards along the supply chain.

Research Focus Area (refer to Appendix for detailed research questions)

Climate Change Resiliency: Understand risks and mitigation strategies to support an agriculture and food sector that is resilient and adaptive to climate change.

Detection and Surveillance: baseline data.

Innovative and Disruptive Technologies and Practices: Identification verification, validation, demonstration and adoption of new, innovative, and disruptive technologies and practices to support a resilient and sustainable agriculture and food sector.

Prevention and Control: Verification and validation of prevention and control interventions

Animal Health and Welfare

Goals

- Enhance public confidence in the sector to deliver on food safety, animal health, plant health, emergency management, and animal welfare expectations and demands.
- Anticipate, detect, mitigate and/or reduce animal health hazards and antimicrobial use along the supply chain.

Research Focus Areas (refer to Appendix for detailed research questions)

[Development of BMPs](#): Development of best management practices to improve farmed animal welfare (e.g., housing, equipment, pain management).

[Emerging Pathogens and Pests](#): Identification and understanding of new and emerging pathogens and pests in farmed animals.

[Health, Welfare and Productivity of Young Animals](#): Reducing morbidity and mortality in young, farmed animals.

[Innovative and Disruptive Technologies and Practices](#): Identification verification, validation, demonstration and adoption of new, innovative, and disruptive technologies and practices to support a resilient and sustainable agriculture and food sector.

[Prevention and Control of Pathogens](#): Development and integration of effective prevention, mitigation and control methods for production limiting, new and emerging diseases, and pest (e.g., antimicrobials or vaccines, biosecurity best management practices, carcass management).

Plant Health and Protection

Goals

- Enhance public confidence in the sector to deliver on food safety, animal health, plant health, emergency management, and animal welfare expectations and demands.
- Help strengthen the agri-food sector's sustainability and social license through increased utilization of integrated pest management (IPM) and other pest mitigation strategies.
- Anticipate, detect, mitigate and/or reduce plant hazards along the supply chain, and improve plant resilience and resistance.

Research Focus Areas (refer to Appendix for detailed research questions)

[Biology of Current and Emerging Pests](#): Understanding of the biology, climate resilience, ecology and management of current and emerging pests, and resistance management. Includes identification, tracking, monitoring, biosecurity practices and protocols, diagnostics, and surveillance.

[Innovative and Disruptive Technologies and Practices](#): Identification verification, validation, demonstration and adoption of new, innovative, and disruptive technologies and practices to support a resilient and sustainable agriculture and food sector.

[Integrated Pest Management](#): Improved integrated pest management strategies through efficacy studies; alternative control options; development of management strategies.

[Pathway Analysis](#): Risks of new/expanding transmission pathways/distribution patterns of pathogens/pests.

ENVIRONMENTAL STEWARDSHIP

Providing Environmental Stewardship of Ontario's capacity to produce food

Soil Health

Goals

- Protect and enhance soil health and water quality, supporting improved public confidence in the sector to deliver on sustainability expectations.
- Improve soil health and conservation to support agricultural productivity.

Research Focus Areas (refer to Appendix for detailed research questions)

[Baseline Soil Health Information](#): Baseline soil health information (i.e., relationship between physical, chemical, and biological components) and development of robust and measurable soil health indicators.

[BMP Development](#): Develop, validate, and continuously improve practices and technologies to support water quality and quantity, soil health, and sustainable agri-food production and processing systems (environmental, economic, social).

[Environmental Impacts of Management Practices](#): Environmental impacts of fertilizer use, nutrient management, and integrated pest management.

Water Quality and Quantity

Goals

- Protect and enhance soil health and water quality, supporting improved public confidence in the sector to deliver on sustainability expectations.
- Strengthen the agri-food sector's sustainability and social licence through improved water use and water quality.

Research Focus Areas (refer to Appendix for detailed research questions)

[Analysis of BMP Adoption](#): Understand the behavioural, social, and economic barriers or incentives to BMP adoption by the agri-food sector.

[Climate Change Resiliency](#): Understand risks and mitigation strategies to support an agriculture and food sector that is resilient and adaptive to climate change.

Sustainable Production Systems

Goal

- Strengthen the sustainability of the agri-food sector through (1) Soil health and conservation, (2) Improved water quality (e.g., reduced phosphorus runoff and pesticides), (3) Increased water/waste/energy efficiency and reduced greenhouse gas (GHG) emissions, and (4) Increased utilization of 4Rs Nutrient Stewardship.

Research Focus Areas (refer to Appendix for detailed research questions)

[Analysis of BMP Adoption](#): Understand the behavioural, social, and economic barriers or incentives to BMP adoption by the agri-food sector.

[BMP Development](#): Develop, validate, and continuously improve practices and technologies to support water quality and quantity, soil health, and sustainable agri-food production and processing systems (environmental, economic, social).

[Climate Change Resiliency](#): Understand risks and mitigation strategies to support an agriculture and food sector that is resilient and adaptive to climate change.

[Environmental Impact of Ag Production](#): Understand and quantify the impact of agricultural production systems on the environment (e.g., GHG emissions) to help mitigate environmental impacts.

[Environmental Impacts of Management Practices](#): Environmental impacts of fertilizer use, nutrient management, and integrated pest management.

[Impact of Changing Ecosystems on Ag](#): Understand the impact of changing ecosystems and biodiversity on agri-food production and processing systems to support an adaptive and resilient agri-food sector.

[Innovative and Disruptive Technologies and Practices](#): Identification verification, validation, demonstration and adoption of new, innovative, and disruptive technologies and practices to support a resilient and sustainable agriculture and food sector.

Productive Land Capacity

Goal

- Land use policies contribute to a secure land base that allows the agri-food sector to thrive and reach its full potential.

Research Focus Areas (refer to Appendix for detailed research questions)

[Evidence to Support Land Use Policies](#): Document evidence to inform land use policies that support the long-term success of the agri-food sector.

PRODUCTIVITY AND GROWTH

Fostering the Productivity and Growth of the Agri-food sector and Rural Ontario

Competitive Production Systems

Goal

- Improve production efficiency, productivity, competitiveness and public trust efforts through technology adoption and innovation and technology development such as labour-saving technology or practices, automation, waste reduction, recycling, and increased water/waste/energy efficiency and reduced GHG emissions.

Research Focus Areas (refer to Appendix for detailed research questions)

[Climate Change Resiliency](#): Understand risks and mitigation strategies to support an agriculture and food sector that is resilient and adaptive to climate change.

[Emergency Management](#)

[Improved Management and Processes](#): Improved management and processes (e.g., crop and livestock production systems that improve yields and quality through agronomy, production practices, genetic methods, efficient fertilizer use).

[Innovative and Disruptive Technologies and Practices](#): Identification, verification, validation, demonstration and adoption of new, innovative, and disruptive technologies and practices to support a resilient and sustainable agriculture and food sector.

[Input Use Efficiency](#): Input use efficiency (e.g., alternative feeds, feed efficiency, automation in horticulture; irrigation efficiency in greenhouse, reproductive performance, food processing resource efficiency).

[Labour Access/Efficiencies](#): Research and evidence to support the development of strategies to ensure that the economic growth and sustainability of the agri-food sector is supported by adequate access to labour and/or labour efficiencies.

[Performance Measurement](#): Measure performance through baseline information, trend and gap analysis, impact assessment, and BMP adoption to quantify and benchmark performance.

Innovative Products and Product Improvement

Goal

- Enhance competitiveness, profitability, and growth of the agri-food sector through new or improved products.

Research Focus Areas (refer to Appendix for detailed research questions)

[Innovative and Disruptive Technologies and Practices](#): Identification verification, validation, demonstration and adoption of new, innovative, and disruptive technologies and practices to support a resilient and sustainable agriculture and food sector.

[New Product Development](#): Investigate new products (physical products, services, or processes) to improve marketability and profitability, meet consumer demands, and enhance productivity in the sector, from concept to prototype (e.g., alternative proteins, foods of the future, new crops, bioproducts).

Trade, Market and Targeted Sector Growth

Opportunities

Goals

- Growth of the overall agri-food sector through expansion of existing and access to new domestic and international markets.
- Improve economic performance of identified priority sub-sectors and increased production of niche and/or value-add products.

Research Focus Area (refer to Appendix for detailed research questions)

[Domestic Market Analysis](#): Research, data, and analysis to support Ontario's agri-food sector to remain competitive in domestic markets in response to change and challenges.

[Global Market Analysis](#): Research, data, and analysis to support Ontario's agri-food sector to remain competitive in global markets in response to change and challenges.

[Targeted Sector Growth](#): Identify (in partnership with industry stakeholders), investigate and research opportunities to address targeted sector growth opportunities that will remove key barriers and improve competitiveness of the sector in the areas of dairy

goats, hazelnuts, aquaculture, greenhouse, maple syrup, processed vegetables, processed meats, baked goods, and cannabis/hemp.

Strong Rural Communities

Goal

- Enhance competitiveness, profitability, and growth of rural communities

Research Focus Area (refer to Appendix for detailed research questions)

[Innovative and Disruptive Technologies and Practices:](#) Identification verification, validation, demonstration and adoption of new, innovative, and disruptive technologies and practices to support a resilient and sustainable agriculture and food sector.

[Labour/Access Efficiencies:](#) Research and evidence to support the development of strategies to ensure that the economic growth and sustainability of the agri-food sector is supported by adequate access to labour and/or labour efficiencies.

[Multi-disciplinary collaborations to address complex needs:](#) Research that includes multiple disciplines where goals are set under one thematic umbrella. Participatory, Interdisciplinary, and transdisciplinary research can be considered under this focus area.

[Rural Community Development:](#) Research that strengthens municipal and agri-food sector capacity to identify and successfully implement provincial and other initiatives that are economically sound, environmentally sustainable and support rural community development.

APPENDIX: OMAFRA Research Questions

Food Safety

Research Focus Areas	Question	Rationale for Research and Benefit	Outcomes and Deliverables	RIB ID
Climate Change Resiliency	<i>Foodborne human pathogens and toxins are moving into areas where they were not previously an issue due to several factors including changing weather. What are the food safety risks associated with this, and how can these risks be mitigated?</i>	Changing weather is facilitating the movement of some types of pathogens (e.g., fungi) to new areas, and the production of toxins (such as mycotoxins) in areas where they have not previously been observed. Understanding which pathogens/risks are of most concern, and in which crops/ foods/feed etc. is an important knowledge gap.	This research would identify economically important crops with the highest risks associated with changing weather, allowing for targeted interventions that would reduce economic losses to the agriculture and food sector, and to the provincial economy.	2020.009
Detection & Surveillance	<i>What is the pathogen burden in market-ready lamb, sheep, goat and/or pork in Ontario?</i>	The lamb, sheep, goat, and pork markets in Ontario are smaller than that of beef, therefore there is not as much information on the pathogen burden related to these markets. Research in this area will gather much needed data that will inform provincial operational protocols.	Project results will help establish the risk level of market products such as whole cuts and ground meats from these species, as well as help establish pathogen levels on the carcasses in slaughter plants.	2021.030
Detection & Surveillance	<i>What is the pathogen burden in ground meat products prepared in small-scale, provincially licensed facilities?</i>	Ground meat is particularly at risk for the spread of pathogens due to the comminution process and has been linked to several E. coli outbreaks. Small-scale facilities may not have the rigorous mitigation procedures that large scale and/or federally licensed facilities must reduce this pathogen burden.	Project results will help provide needed data to establish the risk level of ground meat from small-scale, provincially licensed facilities.	2021.029
Detection & Surveillance	<i>What are the residual levels and data required to establish better usage guidelines and withdrawal times in livestock for drugs that have no current documented withdrawal period and no established maximum residual limit (MRL)?</i>	OMAFRA tests for the presence of veterinary drugs in food animals. Some of these drugs do not have an established maximum residual limit (MRL) against which to evaluate the residue level found. Moreover, there is a gap in data which would allow CgFARAD (Canadian Global Food Animal Residue Avoidance Databank) to determine the appropriate withdrawal times (based on residue level/depletion rate) for drugs administered to livestock. Knowing what the depletion rate is for different drugs in different species would be valuable information, to help Health Canada determine	Project results will help to establish the risk level of certain drugs administered to livestock that enter the Ontario market. The results may be used to inform changes to regulatory policy as well as veterinary care best practices. This work would provide some field guidance to vets/producers.	2019.066

APPENDIX: OMAFRA Research Questions

Research Focus Areas	Question	Rationale for Research and Benefit	Outcomes and Deliverables	RIB ID
		MRLs, and help CgFARAD determine appropriate withdrawal times.		
Innovative and Disruptive Technologies and Practices	<i>Innovative research designed to improve the safety of the Ontario food system. To this end, we welcome proposals for novel research projects designed to address food safety issues specific to food grown and/or processed in Ontario.</i> <i>***Note: Proposals must clearly indicate the challenge or opportunity being addressed, stakeholders who would benefit.</i>	The agri-food sector is a major driver of Ontario's economy. Innovative solutions drive enhanced competitiveness, create economic growth, and strengthen the safety of Ontario's food supply.	Development of innovative technologies, products, and practices which address the food safety challenges facing the sector and capitalize on opportunities will enable Ontario's agri-food sector to be more competitive, productive, sustainable, and resilient while protecting an efficient, reliable and responsive food supply.	2023.015
Prevention & Control	<i>What practical / feasible interventions or technological development at any point in the value chain are effective for reducing or mitigating pathogens on Ontario-produced minimally processed or ready-to-eat (RTE) fruits and vegetables, particularly for small scale producers and processors?</i>	Minimally processed or ready-to-eat fruits and vegetables become contaminated with pathogens and have been attributed to several recent outbreaks of foodborne illness. Although there is a considerable amount of research on effective interventions, there may be barriers to their adoption and implementation.	Project results would be used to promote effective risk management strategies that incorporate interventions to reduce or mitigate pathogen contamination and have a greater potential to be adopted and implemented. This will lead to a decrease in the number of reported cases of pathogens in food, the number of food recalls, and the incidence of food-related outbreaks and illnesses.	2019.061

Animal Health and Welfare

Research Focus Areas	Question	Rationale for Research and Benefit	Outcomes and Deliverables	RIB ID
Development of BMPs	<i>How can we improve preventative management practices and nutritional strategies to optimize health and</i>	Livestock of all species can suffer production-related diseases related to performance expectations. Understanding how to optimize this nutrition, as well as alternatives that can be used during feed shortages that	An understanding of how nutritional strategies can be used to support optimal equine health and performance. Results may provide insight for other species.	2022.015

APPENDIX: OMAFRA Research Questions

Research Focus Areas	Question	Rationale for Research and Benefit	Outcomes and Deliverables	RIB ID
	<i>performance in livestock (including equine and aquatic species)?</i>	may be caused by climate change, natural disaster, or supply chain issues, will support equine health and welfare. Development and adoption of management and nutritional strategies to address health issues (outside of conventional antimicrobial control measures) are necessary to improving cattle health, welfare, and performance. Results may also provide insight for other livestock species.		
Development of BMPs	<i>How can we promote the prudent use of medications or chemotherapeutics, including antibiotics, in food animal minor species (including aquatic species) through drug depletion studies to obtain appropriate milk and meat withdrawal information?</i>	There are few to no approved products for food animal minor species, therefore there is no withdrawal information available. Withdrawal information supports food safety, protects animal health and welfare, and encourages the prudent use of antibiotics and other medications. Minor species includes sheep, goats, honeybees, aquatic animals, rabbits, cervids, bison, and others.	Drug depletion and residue studies to validate timing and use concerns while ensuring food safety and animal health/welfare. Reduce off-label drug usage.	2022.012
Development of BMPs	<i>What best management practices can be employed in the livestock industries to mitigate the risk of zoonotic diseases or livestock diseases where animals are models for human disease, to improve animal welfare while also informing, or, minimizing the impact of disease on, the health of people working in those industries from a one health perspective? What are the potential risks or benefits of these BMPs to the immediate environment shared by both livestock and humans (e.g., barn, farm premises) and/or to the broader environment (including feed production, impacts on wildlife, etc.)?</i>	One health is a holistic approach which defines the health of humans, animals, and the environment as a coherent system. Livestock (including equine and aquatic species) have had an integral role in One Health through their close relationship with humans and their role in eco-diversity. For an example, horses have been a research model for human diseases for centuries and thus have had a pivotal role in comparative and translational medicine. The local environmental conditions from air quality in livestock barns to ground surfaces on which horses compete have a significant effect on both livestock and the people who interact with them. As well, climate change that affects vector dispersion, air quality and availability of different feeds impact both human and equine conditions. Understanding these interrelationships will further efforts to improve the entire one health system.	BMPs are used to mitigate livestock diseases. More translational research will inform human and environmental health and identify interventions that can improve the entire one health system.	2022.011

APPENDIX: OMAFRA Research Questions

Research Focus Areas	Question	Rationale for Research and Benefit	Outcomes and Deliverables	RIB ID
Development of BMPs	<i>How can we improve preventative management practices and nutritional strategies to optimize rumen health and performance of feedlot cattle?</i>	According to the 2016 Canadian Beef Quality Audit, the incidence of liver abscesses detected at slaughter as part of the study has increased over the last number of years. The presence of liver abscesses is associated with suboptimal rumen health conditions. Development and adoption of management and nutritional strategies to address rumen health issues (outside of conventional antimicrobial control measures) are necessary to improving cattle health, welfare, and performance.	Identification of existing and novel approaches to mitigate rumen health issues in feedlot cattle	2021.007
Development of BMPs	<i>What tools and techniques can be used to drive behaviour changes throughout the farm to processing continuum that will support best practices for biosecurity and animal management within specific commodity sectors?</i>	Increasing the adoption of best practices related to labour (e.g., following public health guidelines), biosecurity and animal management is extremely important to ensure human and animal health and welfare. It is also important to determine and identify tools and techniques (education, policies, programs, legislation, etc.) that act as both barriers and incentives to the adoption of best practices and understand any associated economic and sustainability considerations.	Research will help provide an understanding of what motivates producers to adopt a best practice. The results would assist commodity associations and OMAFRA with modifying tech transfer approaches to get better uptake of best practices, which will reduce COVID-related impacts to farm businesses moving forward.	2019.075
Development of BMPs	<i>How can stress, pain and injuries be reduced during transportation, at livestock markets and at slaughter facilities or other key handling points for livestock, poultry, and aquatic species?</i>	Transportation, market, and slaughter are crucial periods in animal production. Research is needed to better address sources of animal health and welfare concerns. Livestock codes of practice (transportation time) are in flux and need evidence to support their development.	Codes of practices are under development for some species; knowledge from research could be used to guide evidence-based decision making. Handling, tools and best practices for market and slaughter facilities will be improved to support animal health and welfare.	2019.070
Development of BMPs	<i>Are there new technologies or management practices that can eliminate/reduce known painful conditions such as lameness and the need to further alleviate and prevent the stress and pain of currently accepted practices/procedures? (i.e., debudding in</i>	There are currently few options available to reduce pain or stress during certain management procedures (i.e., dehorning, castration, tail docking, teeth clipping, hoof trimming) and these options often require significant labour and/or cost to a producer. More options are needed to reduce time and cost requirements while still ensuring pain/stress reduction. Pain management for goat disbudding is a priority research issue from	New best practices associated with common animal procedures, or new technologies to reduce the need for these procedures.	2019.069

APPENDIX: OMAFRA Research Questions

Research Focus Areas	Question	Rationale for Research and Benefit	Outcomes and Deliverables	RIB ID
	<i>goats, dehorning, castration, tail docking, teeth clipping, hoof trimming).</i>	updates to the Code of Practice for the Care and Handling of Goats.		
Development of BMPs	<i>What are economically viable housing systems and management practices, which align with market and consumer demands and meet animal health and welfare needs? Examples of identified species-specific research gaps in this area include the impact of flooring surface in housing and transfer areas on dairy goat hoof health and lameness, as well as need for poultry and swine.</i>	There are several challenges with animal disease transfer, social interactions, mortality, environmental quality, management practices and labour efficiencies within different housing options. The diversity of housing systems brings this diversity of issues in need of addressing to develop BMPs for individual systems and management practices.	Outcomes will include knowledge regarding housing systems and management practices that support economical, sustainable, and efficient production, as well as optimized animal health and welfare.	2019.068
Emerging Pathogens and Pests	<i>How can the risk of new and expanding transmission and distribution pathways of pathogens and pests be identified (diagnosed), quantified and mitigated in a timely and cost-effective manner?</i>	Results of this research will contribute to the ministry's leading role in prevention of, response to and recovery from agricultural related emergencies, help fulfill the ministry's legislative responsibilities and fulfill commitments to our federal, provincial and industry partners in emergency management. Current gaps exist regarding zoonotic, tick borne and parasitic diseases that impact multiple species and humans. The growing change in climate also introduces new concerns.	Outcomes of research will support the ministry responding to agricultural emergencies; prevention and control of new and emerging risks to the agri-food sector.	2019.073
Emerging Pathogens and Pests	<i>How can feed infected with mycotoxins be utilized for livestock without impacting animal health or performance? (Could include new testing technology.)</i>	With changing weather, mycotoxins are an increasing concern for animal feed; industries continue to struggle with mycotoxin loads.	Sectors that are predominantly grain fed will be provided with information and mechanisms to alleviate negative health and nutrition effects or concerns of feeding grain contaminated with mycotoxins.	2019.072
Health, Welfare and Productivity of Young Animals	<i>What tools are available to improve and evaluate colostrum quality to mitigate the increasing issue of lamb and kid mortality?</i>	Sheep and goats are dependent on colostrum to protect them in early life from pathogens because little immunity passes through the placenta. Little is known about what factors in the diet influence and can be used to improve sheep and goat colostrum quality. Improved knowledge is also needed to accurately assess sheep colostrum quality as sheep colostrum is significantly	Recommended nutrition best management practices to improve colostrum quality in sheep and goats producing multiple lambs/kids. Producer tools to evaluate colostrum quality on farm. Improved colostrum quality in ewes/does with multiple lambs/kids would result in a reduction in	2021.031

APPENDIX: OMAFRA Research Questions

Research Focus Areas	Question	Rationale for Research and Benefit	Outcomes and Deliverables	RIB ID
		different from goat or cow colostrum. Tools are urgently needed to reduce lamb and kid loss to deliver on public expectations of animal welfare.	mortality of young lambs/kids on Ontario farms.	
Health, Welfare and Productivity of Young Animals	<i>How do we improve the survivability of young, farmed animals?</i>	A prominent concern from multiple livestock sectors continues to be concern for reducing risk of disease and mortality in young livestock. Specific factors leading to disease and mortality are largely unknown for several species. Benchmarking number of losses and cause of losses is needed to determine best practices or development of treatments to mitigate.	Knowledge to support livestock sector to improve morbidity and mortality rates in those industries with specific concerns; new recommended management practices, disease prevalence rates to better inform producers, development of solutions or treatments for producers to adopt.	2019.071
Innovative and Disruptive Technologies and Practices	<i>Emerging Issues in Animal Health and Welfare: Identify new innovative opportunities that address animal health and welfare challenges facing Ontario's livestock, poultry and aquaculture industries</i> <i>Emerging Issues are potential new threats or problems to animal health and welfare that can impact local resources, the environment or populations.</i> <i>Projects submitted under this RNI must not fall under any existing priority question within this call document. A case of why the applied project is an emerging issue must be included.</i>	Grow the tools available to producers to support the health and welfare of livestock, poultry and aquaculture species. Emerging needs could include but is not limited to zoonotic disease, environmental impacts and traceability.	Research outcomes could include improved best management practices, nutritional strategies, treatments and creative solutions to challenges facing the livestock industry.	2023.014
Prevention & Control of Pathogens	<i>What are the therapeutic tools and alternatives or management programs that will improve the prudent use of or reduce the need for pharmaceutical interventions such as antimicrobials, anthelmintic or other treatments? What are the impacts of these alternatives on animal, public health, economic and</i>	There continues to be a requirement to shift practices to those that support protection and assurance of the agri-food sector while adopting more prudent use of antimicrobials and medications in livestock agriculture/aquaculture. All sectors are looking for alternatives to antibiotics. There are also concerns highlighted by staff and industry regarding availability of pharmaceuticals for several species, i.e., small	Alternative prebiotics, probiotics and vaccines, alternatives to pharmaceutical use, and management strategies that can reduce the need for use of these. Drug depletion and residue studies to validate timing and use concerns while ensuring food safety and animal health/welfare. Reduce off-label drug usage.	2019.067

APPENDIX: OMAFRA Research Questions

Research Focus Areas	Question	Rationale for Research and Benefit	Outcomes and Deliverables	RIB ID
	<i>environmental sustainability? Not limited to genetic improvement; may include management strategies.</i>	ruminants continue to face the issue of off-label use for most antimicrobials.		

Plant Health and Protection

Research Focus Areas	Question	Rationale for Research and Benefit	Outcomes and Deliverables	RIB ID
Biology of Current & Emerging Pests	<i>What are the biological, epidemiology, economic impacts and/or management options for new and emerging pests that threaten Ontario crops (including pests with expanding ranges, pesticide resistant pests, invasive pests)? How can this research improve the resiliency of crop sectors?</i>	New and emerging pests are constantly appearing. We require better ways to identify and understand their impact and develop ways to manage them before they become an issue. Risk management strategies to deal with emerging pests because of climate change and other factors are needed. With the loss of several pesticide tools, there is an increased reliance on crop protection products with a high risk for resistance development. Forecasting methods, predictive tools, economic thresholds are needed for various pests for Ontario specific conditions.	Research outcomes will improve the identification, tracking, monitoring and management of new and emerging pests threatening Ontario crops. Research on pesticide resistance will strengthen recommendations on pesticide use and develop BMPs to reduce the occurrence and spread of resistant pests.	2020.102
Biology of Current & Emerging Pests	<i>Are there commercial corn hybrids as well as wheat and barley varieties (either through development or identification) that are resistant and/or tolerant to DON (Deoxynivalenol) and more transparent information on DON risk of varieties/hybrids?</i>	Currently there are no corn hybrids or wheat and barley varieties with full resistance to DON available to Ontario corn and wheat growers. Development of resistant hybrids and varieties would give growers another tool to reduce their risk. It may also result in less dependency on fungicide applications which are not 100% effective. There is currently limited information on the DON risk of commercially available corn hybrids in Ontario.	Corn hybrids, wheat, and barley varieties with resistance to DON that are commercially available for Ontario growers. As well as more transparent information on the DON risk of current commercially available corn hybrids.	2020.087
Innovative and Disruptive Technologies and Practices	<i>How can we manage night-time light emissions from greenhouses without negatively affecting production?</i>	More supplemental lighting systems are being used by Ontario greenhouse producers as the greenhouse sector in Ontario grows and the demand for year-round production of food increases. This has resulted in an increase in the amount of night-time light emissions	BMPs on how to grow in greenhouses year-round while reducing night-time light emissions.	2023.006

APPENDIX: OMAFRA Research Questions

Research Focus Areas	Question	Rationale for Research and Benefit	Outcomes and Deliverables	RIB ID
		from greenhouses that have led to nuisance complaints from surrounding communities. More research into different ways of reducing night-time light emissions from greenhouse without negatively affecting production is needed.		
Innovative and Disruptive Technologies and Practices	<i>Which new potato varieties can provide a 12-month supply of high-quality potatoes to the Ontario fresh and chip processing industries including important traits like early maturity, long term storage-ability and nutritional potential?</i>	Improved genetics are critical to ensuring Ontario's potato industry remains competitive and sustainable. New varieties are needed to fill market gaps such as early harvest and long-term storage. Resistance to common scab, late blight, early blight, and drought tolerance are also important considerations.	New potato varieties introduced into the Ontario market. Increased yields, increased marketability, increased pest, and disease resistance and more resilient to climate change impacts.	2022.010
Integrated Pest Management	<i>How do soil microbiomes influence above-ground pests (including insects and diseases) and beneficial species in cropping systems?</i>	Soil microbes such as mycorrhizal fungi are known to have a wide array of plant health benefits. There is little known about their impact on above ground pests, including insects and diseases, that might be reduced from the addition of these soil microbes into the cropping system. In addition, new research indicates insect microbiomes (pests and beneficials) depend on soil microbiomes, with the effects of plants on soil microbiomes being transmitted to aboveground insects feeding later other plants.	Research would demonstrate the direct and indirect benefits of soil microbes on pest and beneficial species in horticultural cropping systems.	2022.020
Integrated Pest Management	<i>Corn rootworm and Bt resistance: 1. What are new effective rootworm management tools to reduce risk of resistance development to Bt traits and soil applied insecticides? 2. What methods, tools and resources are needed to help influence behavioural change to encourage crop rotation options away from continuous corn? Why do these methods work? Determine the most sustainable approach to corn rootworm management in areas with Bt</i>	Corn is grown on approximately 2M acres in Ontario, and corn rootworm resistant to Bt traits has been confirmed. Bt traits are the key method by which corn rootworm has been managed in Ontario. Damage by corn rootworm causes lodging and high levels of yield loss. Livestock producers are reliant on corn silage and are most at risk of resistant corn rootworm as they have corn-heavy crop rotations. Insecticide seed treatments are facing increased restrictions or loss of use, and soil applied insecticides are difficult to fully adopt given equipment requirements. Other management tools and	Integrated pest management (IPM) practices for corn Bt resistant corn rootworm are well understood, communicated, and implemented across Ontario. Expansion of Bt resistant corn rootworm across regions is mitigated, corn yield protected, and Bt technology remains viable in Ontario.	2021.058

APPENDIX: OMAFRA Research Questions

Research Focus Areas	Question	Rationale for Research and Benefit	Outcomes and Deliverables	RIB ID
	<i>resistance. 3. How can predictive tools for key corn pests be improved and what influence and impact climate change will have on the phenology, impact, and management of corn rootworm?</i>	practices are required to limit risk of resistance development of remaining control options.		
Integrated Pest Management	<i>How can robotic and artificial intelligence systems supplement existing agronomic practices such as planting of seeds or transplants (e.g., corn, soybeans, etc.), weeding of row crops (grain, oilseed, and horticulture), surveillance of pests/diseases, identification/rouging of male flowers (e.g., hemp/cannabis), pollination (e.g., hazelnut) and debudding/berry harvesting (e.g., ginseng)? How will new robotic technology in field work be integrated into current production systems? How can these systems help with effective sharing of pest and disease information among plant agriculture sector members/ partners? Projects must include cost benefit analyses and efficiency assessments.</i>	Many robotic and unmanned technologies are under development, and it is likely we will see a fundamental change in farm equipment. Robotic weeding systems are being tested and may offer new integrated pest management (IPM) strategies for herbicide resistant and hard to control weeds. Robotics may improve the ability to screen young seedlings (hemp/cannabis) to identify and remove male plants would be of tremendous benefit to these industries as the presence of male plants is detrimental to cannabinoid yields. Robotic seeders may offer opportunities to reduce soil compaction. There are many innovations on the horizon that may change the way these crops are farmed.	Development of robotic and AI systems would improve the efficiency of existing agronomic practices and reduce labour costs, thereby improving the competitiveness of Ontario farmers. Additional benefits may accrue such as reduced soil compaction, improved site-specific management across a field or of individual plants.	2020.074
Integrated Pest Management	<i>How do we increase capacity to develop and access clean plant material or new pest-resistant cultivars for Ontario?</i>	Systemic diseases present in planting material and a lack of disease-tolerant cultivars is a major barrier to viable specialty crop production in Ontario. Systemic diseases lead to reduced yield and quality and necessitate intensive pest management, greatly increasing the cost of production (COP) of these crops.	Disease-free planting material and pest-resistant cultivars available for major specialty crops in Ontario.	2020.068
Integrated Pest Management	<i>What are some integrated pest management (IPM) technologies or strategies that improve labour</i>	Integrated pest management solutions are needed in all cropping systems. Overreliance on few strategies to manage a pest, especially chemical, is unsustainable	Projects would improve scouting methods, detection, validation and improved thresholds, new pest control products	2020.063

APPENDIX: OMAFRA Research Questions

Research Focus Areas	Question	Rationale for Research and Benefit	Outcomes and Deliverables	RIB ID
	<i>efficiencies, incorporate pesticides, alternative control measures, host resistance and/or take a systems approach to controlling pests? What are the economics of these technologies?</i>	for any pest/crop. It is important to consistently look for new and improved solutions.	(including biopesticides), and other management improvements for growers of field and horticultural crops.	
Pathway Analysis	<i>How does mineral nutrition impact plant disease in ornamental and food crops?</i>	Mineral elements are applied on crops to increase yield and improve plant health. They are needed for improved production efficiency, but little is known about their impact on plant disease. For example, applications of iron sulphate have been shown to directly suppress dollar spot in turfgrass. Micronutrient deficiencies are known to increase susceptibility to disease, but little has been studied on a commercial level in soil and soilless media crops.	This research would contribute to a greater understanding of how plant health and nutrition impact plant disease and make advancements in reduction of pesticide use.	2022.017
Pathway Analysis	<i>How can new disinfection and sanitation technologies and/or processes minimize biosecurity risks from pests throughout the production cycle and through distribution channels?</i>	Better ways to identify and manage pests before they become an endemic issue are needed. Research is needed on risk management strategies to deal with emerging pests because of climate change and other factors. The effects and impact of sanitation on improving biosecurity should be a part of these studies. For example, biosecurity in field can also impact nearby crops (i.e., cull piles impacting nearby crops).	Research outcomes will improve the identification, tracking, monitoring and management of emerging and endemic pests that threaten Ontario production and protect the biosecurity of greenhouses, vertical farms, and field horticultural crops.	2019.084

Soil Health

Research Focus Areas	Question	Rationale for Research and Benefit	Outcomes and Deliverables	RIB ID
Baseline Soil Health Information	<i>How do the interactions between cover crops and other components of the crop production system (e.g., tillage, fertility, crop protection) influence the economic</i>	Two million acres of soybean grown in the province remain soil bare during the non-growing season, which has been shown to be the time of greatest erosion (wind, water, tillage) and nutrient loss. Cover crops and	Better understanding of cover crop management within production systems - with emphasis on reduced risk to cash crops and increased soil benefits - should	2021.059

APPENDIX: OMAFRA Research Questions

Research Focus Areas	Question	Rationale for Research and Benefit	Outcomes and Deliverables	RIB ID
	<i>and environmental effects of including cover crops in the system? How would this contribute to furthering the understanding of the economic and environmental role of cover crops alone and in combination with tillage and other components of the overall crop production system.</i>	reduced tillage help to stabilize soils during the non-growing season and are known to improve soil health and environmental fitness in many ways, yet so many acres remain bare each winter.	lead to greater adoption of these practices. Greater adoption will reduce environmental consequences of crop production and over time enhance the economic performance of Ontario's crop production systems.	
Baseline Soil Health Information	<i>How should soil health tests or indicators be evaluated for accuracy, saliency, and interpretability? What is the minimum dataset (MDS) required for soil health tests that are accurate, cost effective and interpretable? What are best cost-effective indicators of soil health to assess specific soil functions?</i>	Greater certainty is needed regarding what constitutes an effective and practical soil health test. Producers and their advisors require tests that are practical to perform, accurate in quantifying soil health status and that guide improved soil management in an economically feasible way.	Increased confidence in an economically viable soil health test would speed adoption of the methods and lead to more rapid improvement in soil health, thus reducing environmental impacts of crop production and enhancing economic performance.	2020.079
Baseline Soil Health Information	<i>What are best cost-effective indicators of biological soil health to assess soil functions? Functions include soil nutrient supply, carbon cycling and storage, soil structure and water dynamics, plant health and productivity.</i>	Biology is a critical part of soil health, but current measures are limited due to knowledge and cost limitations. A review of existing biological indicators of soil health would help to refine recommended measures in a way that is supported by science and minimizes cost. Examples of projects in this category: Comparing Potential Mineralizable Nitrogen (PMN) to Autoclaved Citrate Extractable (ACE) Protein Index for measuring soil Nitrogen (N) supply, and can permanganate oxidizable carbon (POxC) be used to infer future changes in Soil Organic Carbon (SOC)?	Research will inform improvements in measuring biological health through better indicators or more cost-effective methods for current indicators. Both outcomes would improve uptake of, and management decisions from, soil health tests.	2020.078
Baseline Soil Health Information	<i>How can producers assess soil health in different production systems? (e.g., Grain production vs. specialty crop production)</i>	Crop producers want to improve soil health and want to know how to accurately measure their progress.	An analysis of how soil health differs in field crops, horticultural crops, and specialty crops and tangible ways to assess soil health, either through soil tests, or combined with some other methods.	2019.003

APPENDIX: OMAFRA Research Questions

Research Focus Areas	Question	Rationale for Research and Benefit	Outcomes and Deliverables	RIB ID
BMP Development	<i>What are the tools and methods (e.g., soil and plant tissue/sap testing, etc.) to develop and/or update soil fertility recommendations and plant tissue nutrition guidelines in horticultural crops (existing crops as well as newly introduced crops and cultivars) in Ontario?</i>	Several horticultural crops are grown in Ontario including some relatively new crops (e.g., hazelnut) for which we do not have Ontario-specific fertility recommendations available. For those crops, we are giving guidelines adapted from other agroecological regions. Also, growers have expressed their concerns about existing fertility recommendation for fruits and vegetable crops as outdated - this needs to be updated according to changing cropping systems and management practices (e.g., high density orcharding, high yielding varieties, etc.) thru field based applied research. Growers are generally left to figure out their crop's fertility demands on their own, and while this has been successful for some who have had previous crop experience, it has caused others to lose yields and quality due to under or over-fertilization. It is therefore essential to update Ontario-specific fertility recommendations for horticultural crops in the next few years for new as well as established orchards/farms in Ontario.	Growers will receive updated soil fertility and plant nutrition guidelines for tree fruits, tender fruits, and vegetable crops that will be discussed and approved by Ontario Soil Management Research Steering Committee in the next few years.	2022.019
BMP Development	<i>Since there is little to no research on high organic matter (muck) soil cover crop options, what are the cover crops that fit within a muck vegetable production system and increase soil health parameters while reducing soil-borne pathogens?</i>	Muck soils present a unique challenge for incorporating cover crops into the system due to their intensive high-value crop rotations and short planting windows. High-value crop production also leads to very short rotations and a build up of soil-borne disease issues. Muck soil is also very susceptible to soil erosion and subsidence, making cover crops even more important to preserve soil health and long-term sustainable production. No research on the suitability of cover crops for muck soils specifically has been done so there is great potential for increased grower adoption with customized recommendations.	Identify and develop appropriate cover crop BMPs for Ontario's muck vegetable production system.	2020.077

APPENDIX: OMAFRA Research Questions

Water Quality and Quantity

Research Focus Areas	Question	Rationale for Research and Benefit	Outcomes and Deliverables	RIB ID
Analysis of BMP Adoption	<i>What are the environmental and economic opportunities for farmers for planting switchgrass, miscanthus perennial biomass crops as filter media for capture of phosphorus and as farmable vegetative buffers from harvest sale?</i>	Adoption of planting vegetative buffers is limited by Ontario farmers, with challenges of losing the land and maintenance. Switchgrass has an advantage with deep root systems and biomass yield. To understand the economic benefits from planting switchgrass as vegetative buffers which requires a detailed evaluation on ideal width of the buffer based on field location and logistics for harvesting and costs and returns. The research could examine the potential use of bio crops as filter media. There is a lack of research information to support for farmers adoption.	Supports Ontario farmers adoption of agri. Environment best management practices for soil erosion control and phosphorus capture from runoff water from planting switchgrass and additional revenues from harvested biomass from sale to various end use markets. Outcomes can also include costs and benefits of preventing erosion, soil and nutrient loss, enhanced biodiversity, value of nutrients trapped in the buffer zone as fertilizers. estimating the potential economic returns of growing switchgrass and for developing new cost share incentive programs for farmable vegetative biomass crops buffers.	2021.064
Climate Change Resiliency	<i>What are the potential pathways that pesticides may be transported to surface water and what are the potential impacts to aquatic life? What are some cost-effective mitigation measures/management practices that growers can adopt to reduce the movement of pesticides to surface water from the agricultural application area?</i>	Neonicotinoid insecticides were found frequently in Ontario surface waters and are most agricultural uses are proposed for phase-out. It is important that we better understand the movement of pesticides from agricultural land to water sources and identify potential issues. If there are potential issues with movement of pesticides from agricultural land, mitigation measures need to be investigated that will reduce risk to the environment.	Better understanding of the potential movement of pesticides and environmental impacts. This information can be used in the Pest Management Regulatory Agency's pesticide risk assessments. Ontario is taking a proactive approach to protect the aquatic environment and help maintain/expand growers' pest management toolkit.	2020.084
Climate Change Resiliency	<i>How can we better assess climate change storm event driven nutrient loadings from agriculture?</i>	We lack good data and evidence on non-point source nutrient loadings.	We need greater evidence to demonstrate that these large storm events are contributing to many of the loadings and if we can better deal with this on farm and in communities, we will improve environmental outcomes.	2019.009

APPENDIX: OMAFRA Research Questions

Sustainable Production Systems

Research Focus Areas	Question	Rationale for Research and Benefit	Outcomes and Deliverables	RIB ID
Analysis of BMP Adoption	<i>What are the economic and environmental benefits, barriers, and management options for incorporating more perennial crops in Southern Ontario (i.e., forages, pastures, biomass crops, annual grasses) in corn and soybean rotations?</i>	Corn and soybean production in southern Ontario have been considered as limiting to improving soil health if other crops are not included in rotation. By examining evidence of barriers and options for including more crops in rotation, it may be possible to find ways to increase the practices. This research can inform pasture management and forage production best management practices to support the diverse Ontario agricultural sector and foster greater competition with other jurisdictions.	A report for corn and soybean producers that examines ways to incorporate more perennial crops in corn and soybean rotations while maintaining or increasing profitability and quality is the desired outcome from this research.	2019.014
BMP Development	<i>How do Ontario crop fertility recommendations meet the needs of modern production practices and modern crop varieties, cultivars, hybrids of all crop types?</i>	Crop fertility recommendations developed in past decades may not address the needs of modern crops in both field crops and horticulture crops production systems. Other competitive jurisdictions (e.g., Quebec) have recently reviewed provincial crop recommendations. There is a need for Ontario to also review crop fertility recommendations to ensure both crop production and environmental stewardship goals are being addressed. There is also a need for fertigation recommendations in orchard systems. Important horticulture crops include but are not limited to: Potato, Ginseng, Asparagus, Hazelnut, tender fruit, grape, and high-density apple orchards.	The desired outcome is that Ontario fertility recommendations reflect the current state of production advancement.	2019.029
BMP Development	<i>What novel crop management systems can be developed which enhance economic and environmental benefits in field crop production, for example, multi or relay cropping, including forages, canola, cover crops, and/or other fall seeded crops in rotation? How do these systems affect the economic, agronomic,</i>	This research could help address the following questions. Could diverse multiple species of crops be grown in the same landscape at the same time and separated post-harvest? Would this lead to more diverse and resilient systems of production that would capture more economic and environmental value than current mono, annual crop approaches to crop production? For example, could Canola coffer	The desired outcomes include the analyses of new management practices which increase diversification of crop rotations, including on-farm economics, landscape-level impacts, environmental benefits.	2020.040

APPENDIX: OMAFRA Research Questions

Research Focus Areas	Question	Rationale for Research and Benefit	Outcomes and Deliverables	RIB ID
	<i>and environmental impact of the whole cropping system?</i>	additional benefits (i.e., offers soil health benefits and habitat for pollinators).		
Climate Change Resiliency	<i>What are the effects of climate change on the yield, resilience, pest complex, biomass accumulation, and overall health of tree-based crops?</i>	Climate change is a threat that has wide-ranging impacts across all aspects of plant health. Most of these impacts are poorly understood, and research needs to be done to help growers adapt to farming under a shifting climatic regime. Climate change is an existential threat to several tree-based commodities. Even now, weather extremes are manifesting in early frost damage in tree fruits and tree nuts, and drought conditions that cause yield reductions. Another example is maple syrup, where crop yield is tied directly to temperatures during the spring thaw. The last few decades have seen volatile and shortened maple seasons which have reduced yield.	Information on a) how climate change has affected the growth and health of tree-based crops today compared to how trees performed in the past; b) how different future climate change scenarios will impact tree health and growth; c) potential mitigating actions that growers can take	2022.022
Environmental Impact of Ag Production	<i>How can economic benefits from cover crops (e.g., grazing, harvested as forage) be realized without compromising environmental benefits? i) Investigate various grazing/forage harvest strategies for cover crops and evaluate their profitability and impacts on environmental benefits ii) Determine site and/or operational characteristics that increase the probability of profitably utilizing cover crops while realizing environmental benefits.</i>	Cover crops provide long-term benefits to soil health and crop productivity, but short-term benefits are often not clearly apparent. Producers that rent land on short-term contracts represent a large and increasing acreage of Ontario farmlands. These producers are unlikely to implement cover crops; they would assume the costs, but unlikely to see the benefits. Research suggests there are opportunities to sustainably monetize cover crops within the year of implementation. Investigating these opportunities and providing guidance to producers would provide more incentive for adoption and could lead to increased cover crop acreage.	A report with recommendations on how to utilize cover crops (e.g., grazing strategies, forage harvest at certain conditions, etc.) so that economic and environmental benefits are realized. Report would consider operational and site-specific characteristics.	2019.020
Environmental Impact of Ag Production	<i>Can pH of organic amendments (e.g., digestate, Lystegro, hog manure, etc.) be managed to reduce nitrogen losses?</i>	General pH is not regularly tested in manure, but high pH (>7.7) increases nitrogen (N) volatilization in the first few hours of application. N supplied by the material is much lower than expected and often not supplemented with commercial sources. Research that could	This research could provide improved: <ul style="list-style-type: none"> • prediction of available nitrogen from organic sources with high pH materials • understanding of role of pH in N volatilization, 	2021.060

APPENDIX: OMAFRA Research Questions

Research Focus Areas	Question	Rationale for Research and Benefit	Outcomes and Deliverables	RIB ID
		<p>explore the pH level at which N losses occur more quickly. High pH is a constant in most anaerobic digestate and Lystegro, but not in manure. What leads to high pH (feed additives such as dried distiller grains)? What strategies would be economic to keep pH near 7?</p>	<ul style="list-style-type: none"> • understanding of whether additives (lime/N inhibitors) can economically reduce pH and N losses in storage and/or when field applied, • knowledge of feeds or feed additives or management practices that increase manure pH in specific operations (liquid hog, solid ruminant) • knowledge of predicted available nitrogen from organic sources with high pH materials. <p>This research will also contribute to the understanding of:</p> <ul style="list-style-type: none"> • At what pH level does N volatilization increase, • Are there any economic additives (lime/N inhibitors) that will reduce pH and N losses in storage and/or when field applied, and • Knowledge of feeds or feed additives or management practices that increase manure pH in some operations (i.e., liquid hog, solid ruminant). 	
<p>Environmental Impacts of Management Practices</p>	<p><i>How can additional food and agriculture waste processing capacity be incented in the province? Are there any barriers currently in place? How can additional processing capacity that not only diverts food and agriculture waste but also results in a beneficial end product be encouraged? Are there other opportunities to up-cycle organic waste materials currently being sent for composting or anaerobic digestion?</i></p>	<p>The location of food and agriculture wastes are often located far from the farms needing soil amendments. In addition, such soil amendments are often not widely available or are available at prices too high for widespread use. There needs to be greater understanding of the organizational approaches that would enable efficient acquisition of organic amendments by individual farmers without high transaction costs.</p>	<p>Research outcomes will provide insights to assist in the ability to increase the amount of recovered food and agriculture waste.</p>	<p>2019.023</p>

APPENDIX: OMAFRA Research Questions

Research Focus Areas	Question	Rationale for Research and Benefit	Outcomes and Deliverables	RIB ID
Environmental Impacts of Management Practices	<i>What are the barriers for municipalities and private processors to begin accepting and processing certified compostable products? What system changes would be required for organics processing facilities to accept and process compostables (as currently facilities are designed to primarily manage food waste and may need upgrades to process compostable products and packaging)?</i>	Additional research is needed to address the issue of compostable products and packaging such as cutlery, cups, take-out containers, and coffee pods not being accepted in municipal organic waste collection systems in Ontario.	The research will help support food processors and businesses invest in environmental solutions and may assist in the reduction of barriers to accepting compostables.	2019.024
Environmental Impacts of Management Practices	<i>What compostable packaging options can the food and beverage processing sector rely on to successfully reduce waste? What are the barriers to ensuring certified compostable products and packaging are diverted from disposal and how can they be overcome? To what extent are consumers willing to pay a premium to acquire a compostable version of a product (or the packaging used for a product) versus a conventional one made from non-compostable materials?</i>	We have a lot of difficulty assessing and understanding whether compostable properly compost, or the cross-contamination with non-compostables, and the result of micro plastics contaminating compost or digestate and thus our agricultural fields	Better understanding of soil quality required for end products from compost and digestate.	2019.025
Environmental Impacts of Management Practices	<i>What is the extent, presence, and concentration of environmental chemicals (agrochemicals and agrochemical residues) in beehive products (honey, wax, pollen, propolis, etc.)? What are the adverse effects of these chemicals, including synergistic effects, on bee health, bee reproduction and the environment?</i>	There are ongoing concerns and risks of pesticides to the bee populations. Addressing these in a science-based approach will allow beekeepers and growers to focus on risks mitigation and well as refining integrated pest management.	This research will result in better knowledge of the potential exposures that impact honeybees, at which times of year and at what levels, provide better guidance to growers and beekeepers on strategies to reduce pesticide risks and help in identifying which pesticides and patterns of use are lower risk.	2021.069

APPENDIX: OMAFRA Research Questions

Research Focus Areas	Question	Rationale for Research and Benefit	Outcomes and Deliverables	RIB ID
Environmental Impacts of Management Practices	<i>How do management practices (including inputs) impact the carbon sequestration potential of tree-based crops?</i>	There remains a dearth of empirical information on carbon sequestration in woodlots and in managed orchards, as most Ontario literature is published for agroforestry systems (tree-based intercropping, windrows, etc.). This results in a lack of good management practices with an end goal of carbon sequestration, as well as a lack of specific figures to use in carbon sequestration calculations, both from a tree biomass and inputs standpoint. There is growing pull among woodlot and sugarbush owners who are interested in taking part in the burgeoning carbon market. However, these producers lack the necessary tools to make the best management decisions to maximize carbon sequestration.	1) Best management practices to maximize carbon sequestration for trees in both woodlots and managed orchards, on topics including row spacing, silvicultural practices, inputs, pruning, soil management, etc. 2) Critical information for accurately measuring carbon sequestration efforts and comparing different methodologies (e.g., allometric equations for calculating woody biomass accumulation in trees under different growing conditions, direct and indirect emissions from the production and use of various inputs, etc.).	2022.023
Environmental Impacts of Management Practices	<i>What are the potential impacts of emerging substances of concern (ESOC) that may be associated with the application of amendments to agricultural soil in Ontario, based on the current regulatory framework and best management practices for nutrient management?</i>	ESOC, such as microplastics, nanoparticles, and per- and poly-fluoroalkyl substances (PFAS), are often used in a wide range of consumer products and commercial or industrial applications, hence often found in households (e.g., house dust) and the environment (e.g., water, soil, air). There are concerns that some of the ESOC can adversely impact human health and other living organisms. Inadvertently, some ESOC may be present in various amendments (e.g., fertilizers, manures, digestates, sewage biosolids, municipal composts) that are applied to agricultural land to improve or maintain soil health and/or provide nutrients to crops. Research is needed to verify that Ontario's current standards and best management practices (BMPs) related to the beneficial use of soil amendments continue to be protective of human and environmental (e.g., soil, water, crops, livestock) health, even though it may contain some levels of ESOC. Research is	Provide background levels of ESOC in Ontario soils, crops, livestock and soil amendments. Compare ESOC levels between soil and crops that have and have not received soil amendments that may contain ESOC. Compare ESOC levels in soil and crops that have and have not received soil amendments that may contain ESOC to existing guidelines or available data from other jurisdictions. Quantify the relative contribution of ESOC in agricultural soil that may be associated with the beneficial use of soil amendments in Ontario. Identify potential sources of ESOC in agriculture, other than soil amendments, and that may be taken up by plants or livestock (e.g., irrigation water, animal feed)	2023.004

APPENDIX: OMAFRA Research Questions

Research Focus Areas	Question	Rationale for Research and Benefit	Outcomes and Deliverables	RIB ID
Emergency Management	<i>The rapid rise of e-commerce resulting from shifting consumer preferences and demand for agri-food products (e.g., increased home cooking, reduced restaurant/food service demand, shift in meat consumption) has highlighted key supply chain weaknesses (e.g., retail vs wholesale distribution channels, bulk vs consumer packaging). How can consumer preferences be expected to continue to evolve post-pandemic? How can the agri-food supply chain become more resilient while also meeting consumer demand?</i>	development suited to consumer preferences to be competitive with these emerging cultivars. The pandemic resulted in closures of many food service establishments and shifts to takeout/delivery only. Consumers moved to increased meals at home and home cooking, with reduced reliance on food service establishments. Products with high use in food service experienced significant sharp decrease in demand (e.g., bacon, potatoes). Supply chain challenges prevented some products from being redirected to the consumer supply chain due to packaging and distribution limitations (e.g., bulk packaging not suitable/practical for retail). Consumer preferences for certain products in home cooking may be different than in food service establishments. Increased flexibility in the agri-food production system and distribution supply chains to rapidly respond to shifting consumer preferences and market demands more effectively will contribute to a stronger and more secure food supply.	Evaluate the state of knowledge and research needs in similar jurisdictions that aligns with this research question. Prepare a state-of-the-practice synthesis document that identifies gaps, provides direction, and includes recommendations on preliminary project concepts for future policy and program development.	2020.097
Improved Management Processes	<i>How can we improve the way greenhouses capture and use carbon dioxide for enrichment with the goal of reducing their greenhouse gas emissions?</i>	Carbon dioxide (CO ₂) enrichment is important for greenhouse production because when plants grow, they consume CO ₂ , and if CO ₂ levels drop below a certain threshold, then it can negatively affect production. Currently, some greenhouse producers recycle their flue gas CO ₂ by running their natural gas boilers during the day, when they need the CO ₂ , while storing the hot water that is generated for use to heat the greenhouse mainly at night. But when the hot water storage tanks are full greenhouse produces can no longer use their boilers for CO ₂ enrichment. Some greenhouse producers don't recycle their flue gas CO ₂ at all because they heat their older greenhouses with steam which can't be stored. In these cases,	The expected outcomes of these projects include developing new and/or more efficient and cost-effective ways of using flue gas CO ₂ or direct air capture technologies to enrich the plant growing environment in greenhouses to maximize production while reusing carbon onsite and minimizing greenhouse gas emissions. Projects will also include economic assessments of existing and new carbon capture technologies that can be used in greenhouses. This will improve the sustainability of the greenhouse sector while making it more competitive.	2023.017

APPENDIX: OMAFRA Research Questions

Research Focus Areas	Question	Rationale for Research and Benefit	Outcomes and Deliverables	RIB ID
		greenhouse producers purchase liquid CO ₂ for enrichment, while their flue gas CO ₂ is wasted. If there are better ways to capture, store, and reuse CO ₂ from greenhouse flue gas or from other sources such as direct air capture then greenhouse producers can reduce their reliance on liquid CO ₂ and reduce their greenhouse gas emissions.		
Improved Management Processes	<i>How do you apply animal manure on minimal till/no-till cropping systems without negative environmental impacts (e.g., GHG emissions)?</i>	While conventional tillage practices allowed farmers to mix manure into the soil, it is unclear what the best approach is to incorporating animal manure in a minimal/no-till cropping system without negatively impacting the environment (e.g., estimate the total GHG emission associated with storage and application on farm or atmospheric ammonia loss from manure storage, composting, manure solid or liquid nutrient application).	Research outcomes will include best management practices for manure applications in minimal or no-till systems (i.e., may include a Life Cycle Analysis (LCA)).	2023.013
Improved Management Processes	<i>How to manage crop residue challenges and optimize crop production, profitability, and sustainability under minimal till/no-till cropping systems?</i>	Minimal till/no-till farming systems have advantages and challenges in the management of previous crop residues. One big benefit of these systems is the significant amounts of crop residue left on the soil surface, which protects the soil from erosion and improves soil health. Research is needed to better understand how crop residue management can improve crop production and profitability under a minimal/no-till cropping system.	Research outcomes will include best management practices for crop residues in minimal or not-till questions.	2023.008
Improved Management Processes	<i>Can automation of the labour-intensive management of compost bedding pack barns reduce carbon substrate use and achieve an investment payback period of less than 5 years?</i>	Compost bedding pack barns are well suited to Ontario's climate and size of our dairy farms. These facilities require daily repetitive labour to manage the pack. An automated system could improve performance of the compost pack, reduce labour, save material input costs, and improve milk quality. This work would also support animal health improvements	Validation of robotic technology for use in Ontario conditions, calculation of the return on investment; determine carbon material savings; measures of cow health and milk quality and animal behaviour around autonomous equipment.	2022.004

APPENDIX: OMAFRA Research Questions

Research Focus Areas	Question	Rationale for Research and Benefit	Outcomes and Deliverables	RIB ID
	<i>tree nuts, culinary and medicinal herbs, hops, biomass crops) be evaluated and adapted for field production in Ontario (e.g., agronomy, cultivar evaluations, maximizing yield and quality under Ontario growing conditions, storage technology, packaging)?</i>	and establishment, fertility and water requirements, season extension, harvesting methods and post-harvest handling and storage in new and speciality crops.	outcomes will include best management practices in establishing new crops, pre- and post-harvest handling, fertility, and water requirements.	
Improved Management Processes	<i>What is the economic viability and environmental sustainability of small-scale land-based recirculating aquaculture systems (RAS) to produce market size Salmonids?</i>	Land-based RAS aquaculture for market size Salmonids is a new and emerging mode of aquaculture production with major worldwide development projects currently established or in development. The economic viability of RAS aquaculture producing market size Salmonids has not been demonstrated and a better understanding of the environmental sustainability is needed. Research supporting the economic viability and/or environmental sustainability of RAS aquaculture would initiate investment interest. RAS aquaculture can facilitate the diversification of fish production in Ontario, provide agricultural diversification opportunities for terrestrial agriculture and enhance the sustainability of Ontario aquaculture.	Applied research supporting the economic and environmental sustainability of RAS aquaculture producing market size Salmonids. Applied research supporting regulatory environmental guidelines and environmental assessment procedures for RAS aquaculture.	2020.019
Innovative and Disruptive Technologies and Practices	<i>What new technologies and/or processes can advance Ontario's digital ecosystems in Agri-Food to enhance competitiveness, grow market opportunities, and strengthen Ontario's agri-food sector?</i> <i>***Note: Proposals must clearly indicate the challenge or opportunity being addressed, stakeholders who would benefit.</i>	Grow the use of data to support business decisions and increase efficiencies within the agri-food sector and value chain. Digital ecosystems could be (not limited to) processes, traceability tools, platforms and/or governance in any capacity (e.g., corporate, policy, etc.).	Stakeholder outreach should be tailored to the audience. A diverse and inclusive stakeholder engagement plan is preferred. Projects with multi/inter/trans-disciplinary teams are preferred. Teams should be equipped to consider impact(s) on equity and representativity of deserving groups. Development of innovative technologies, products, and practices which address the challenges facing the sector and capitalize on opportunities will enable Ontario's agri-food sector to be more competitive,	2023.011

APPENDIX: OMAFRA Research Questions

Research Focus Areas	Question	Rationale for Research and Benefit	Outcomes and Deliverables	RIB ID
Innovative and Disruptive Technologies and Practices	<i>What are some labour-saving technologies (e.g., automatic, mechanic, chemical and/or precision tools) and management practices (e.g., canopy management and training systems, irrigation, water use efficiency, fertilizer) that can be used to improve labour and operational efficiencies in horticultural crops?</i>	The Ontario horticulture industry is very reliant on manual labour. The COVID outbreak has made it clear that growers must fine options for reducing their reliance on manual labour. Improved processes/systems/technologies that reduce the impacts of and/or costs of activities such as pruning, thinning (chemical thinners), harvesting and packing are needed. New technology including drones and robots are being developed to automate pest management and monitoring and production practices. These new technologies must be tested for their applicability to other production systems. Ultraviolet light (UVC) technology and robots for pest management and production practices, drones for monitoring and beneficial release, and robotic harvesters should be investigated. Technology that automates yield and fruit size data will help optimize labour and promote planning, marketability, and sales. An essential component in improving labour efficiency and mechanizing orchards is to have orchard/vineyard systems that are designed to accommodate new technologies.	Develop and validate new technology that will help reduce labour costs and improves efficiency.	2020.034
Innovative and Disruptive Technologies and Practices	<i>What opportunities and innovative technologies are available to reduce, recycle (including up-cycling for energy recovery and polymer regeneration), repurpose and/or replace used plastics from the agri-food sector including farms, orchards, greenhouses, nurseries, and food & beverage processing operations?</i> <i>Proposals must include the following:</i>	In Canada, plastics recycling has typically been conducted at offshore locations, but recent limitation on the shipping of used plastics has resulted in an increased cost to dispose of plastics and increased demand for new ways to recycle, repurpose and transform plastics within Canada. The development of plastic recycling or reuse capacity within Ontario could address the used agricultural plastics issue as well as create a new revenue stream from the sale of the recycled plastic feedstock. Potential areas of research include bioplastics, engineered fuel pellets, repurposing	To identify new ways for Ontario's agri-food sector (including prime production and food and beverage businesses) to verify and adopt new and innovative technologies and practices to support the recycling, reuse or replacement of plastic products generated by the sector. To support the development of new and disruptive technologies and services (including a new service sector) to support a	2019.057

	<p>and product quality and maximize economic return.</p> <p>Note: Proposals must include a Value Assessment Plan.</p>	<p>validated production, post-harvest handling and processing information is a major roadblock to sector growth. Research is needed to develop new germplasm, to understand the best way to cultivate hemp for seed, fibre, and flower (CBD), to harvest flower (for CBD) from large acreages and the logistics of supplying to licensed processors.</p>	<p>support help the sector to leverage this new economic opportunity for which Ontario has a first mover advantage. Currently the ability of Ontario hemp growers to produce flower competitively and economically are limited by a lack of Health Canada approved high CBD hemp cultivars. This research will allow development of these cultivars, thereby allowing Ontario growers to compete with other jurisdictions through the production of CBD rich oils and germplasm that can be sold globally.</p>	
Input Use Efficiency	<p>What new or improved technologies and strategies can be used to provide controlled environment agriculture (greenhouse, warehouse, and vertical farms) with alternative ways of meeting energy and natural resources needs (electricity, water, heating, supplemental carbon dioxide and natural gas)? (e.g., improved electricity generation and storage, improved water collection/production techniques)</p>	<p>Controlled environment agriculture (greenhouses, warehouses, and vertical farms) acreage has been increasing at annual rate of 5-7% per year for the past 10 years, and this pace of expansion for these production systems is on track to meet or exceed that in the next 10 years. The growth of the greenhouse sector has been concentrated in southwestern Ontario, and it has increased demand for electricity, water, and natural gas. This has put such a strain on municipal and provincial infrastructure in that region, such that Union Water implemented a water moratorium in 2021 on new greenhouse projects until updates to its aged unfractured were complete. New ways of reducing demand on the existing infrastructure for the controlled environment agriculture sector (electricity, water, and heating) are needed to sustain today's growth and to be competitive internationally in the future.</p>	<p>Technologies that will provide controlled environment agriculture with the resources it needs to grow, while reduce dependence on publicly/privately supplied (electricity grid, and water and natural gas supply).</p>	2019.089
Input Use Efficiency	<p>How can we improve the quality and health of seedlings and/or cuttings produced in propagation greenhouses (e.g., using supplemental lighting, and/or</p>	<p>There are only a few propagation greenhouses in Ontario that supply the majority of the vegetable, fruit, and ornamental seedlings and cuttings used in production greenhouses. 	<i>heating/cooling technologies, and/or IPM strategies)?</i>	seedlings and cuttings that are transplanted into production greenhouses affect yield and quality of the vegetables, fruits, and ornamentals. There is a need in the greenhouse sector to improve the quality and health of seedlings and cuttings in order to maximize the yield and quality of crops in production greenhouses.	of seedlings and/or cuttings for production greenhouses.	
Input Use Efficiency	<p><i>Food and Organic Waste: What are the opportunities and barriers for Ontario's agri-food sector to reduce and/or divert food and/or organic waste to create alternate products, generate revenue from and establish markets for/from these materials?</i></p> <p><i>Preferred projects will address one or more elements of the following:</i></p> <p><i>a. What are the economic costs and benefits of these opportunities?</i></p> <p><i>b. Which waste sources are best suited for which revenue streams?</i></p>	<p>There is a gap of knowledge on how best to manage mixed organic waste streams (including food and organic waste) in a cost effective and/or profitable way. Options could include converting culled fruit and vegetables to food products, including centralized de-packaging of food waste, solutions for rural municipalities, solutions for rural food processing businesses, achieving quality targets for contaminants, availability and cost of technologies, regulatory pathways, balance between feedstock volumes and end-use destinations.</p> <p>Potential materials include unsold crops (e.g., crop residuals, horticulture, nurseries, and greenhouses), cheese whey and skim milk.</p> <p>Potential cost savings could come from diverting imperfect produce to gleaning operations, where the reduced volume of residuals is diverted to other conversion processes other than landfill or composting.</p> <p>Potential revenue sources including conversion into food products, industrial acids, nutraceuticals, nutritional supplements, bio-resin extraction, Renewable Natural Gas (RNG) and use in biogenic digestion/reformation, biochar, animal feed, and other new products.</p>	To identify and validate innovative technologies and practices to reduce the volume of edible, inedible and condemned products going to landfills. To satisfy objectives in the Made-in-Ontario Environment Plan on the reduction and diversion of food and organic waste from businesses. To inform Ministry policies supporting the development and expansion of the renewable natural gas (RNG) sector. To inform the adoption of Best Practices linked to Zero Carbon production and processing. To provide a rough order of magnitude and business case for the size of the resource, and its commercial value or economic cost where the cost of a practice does not generate sufficient revenue from its outputs to cover the cost of that practice (i.e., landfill, food rescue, municipal composting).	2019.058

APPENDIX: OMAFRA Research Questions

Research Focus Areas	Question	Rationale for Research and Benefit	Outcomes and Deliverables	RIB ID
Labour Access/Efficiencies	<i>What are available cost-efficient manual labour-saving technologies (e.g., automation or other) for the agri-food sector which have been successful adopted or can be successfully adopted to reduce manual labour shortages (e.g., fruit and vegetable picking, processing of animals in meat facilities)? How does this technology currently compare to manual labour productivity? What is the cost/benefit of adopting such technology?</i>	Labour shortages are expected to be an ongoing issue in the agri-food sector for years to come. New technology is evolving to address agri-food manual labour shortages. There is a lack of Ontario data on what technologies are available/are being adopted, what the criteria are to purchase/adopt new technologies (e.g., concerns, risks, return on investment (ROI), technical staff needed, farmer/food processor socio-demographic characteristics) and what policies or programs will accelerate/expand the adoption of efficient manual labour-saving technologies in Ontario's agri-food sector.	Results from this research could: 1. Quantify the rate of adoption of labor-saving technologies in Ontario's agri-food sector (horticulture, meat processing, food processing) by North American Industry Classification System (NAICS) code. 2. Perform a comparative study of automation technology in the field crops (such as corn and soybean versus the horticultural sector to test the hypothesis that automation is more prevalent for these crops (corn and soybean) than any horticultural crop in Ontario and the conditions (e.g., Farm Implements Act, Grains Act) that induced this adoption over time. Do a similar such study for the meat processing/food processing sub-sector. 3. Socio-demographic characteristics of farmers/meat processors/food processors adopting technologies faster than others. 4. The ultimate objective would be to understand the root causes of technology adoption rates (horticulture, meat processing, food processing) so that OMAFRA and its partners are able to activate the proper policy and industry levers to affect the desired agreed upon change. 5. Identify which labour-saving technologies are the most suitable to encourage Ontario's agri-food sector to explore and consider for adoption.	2021.006
Performance Measurement	<i>What is the environmental footprint of Ontario's equine industry? How can best</i>	Very little is known about the environmental impact of horse farms. Excluding nutrient management, there are	We will understand the impact the equine industry, or sectors thereof, have on the	2022.014

	<i>management practices or benchmarks be used to improve sustainability of the sector?</i>	few focused processes on farm to reduce, re-use, recycle. Environmental concerns are an important focus area particularly for certain generations (i.e. Millennials and Gen Zeds) who are the future of the industry.	environment. Measures can be evaluated to reduce these impacts.	

Innovative Products and Product Improvements

Research Focus Areas	Question	Rationale for Research and Benefit	Outcomes and Deliverables	RIB ID
Innovative and Disruptive Technologies and Practices	<i>What new innovative opportunities (technologies, products, practices) address challenges facing Ontario's agri-food sector and/or capitalize on prospects to enhance competitiveness, grow market opportunities, and strengthen Ontario's agri-food sector?</i> <i>***Note: Proposals must clearly indicate the challenge or opportunity being addressed, stakeholders who would benefit.</i> <i>***Note: Proposals must include a Value Assessment Plan</i>	The agri-food sector is a major driver of Ontario's economy. Innovative solutions drive enhanced competitiveness, create economic growth, and strengthen Ontario's agri-food sector through increased productivity, reduced inputs, sustainable production, addressing labour issues and development of new products for domestic and global markets, alternative uses for existing products, adding value to existing food commodities and integrated supply chain solutions including novel technologies with disruptive potential.	Resulting outcomes are to be commercially deployable to users or consumers of the technology, product or practice. Development of innovative technologies, products, and practices which address the challenges facing the sector and capitalize on opportunities will enable Ontario's agri-food sector to be more competitive, productive, sustainable and resilient while protecting an efficient, reliable and responsive food supply.	2023.001
Innovative and Disruptive Technologies and Practices	<i>With the adoption of smart farming technologies by a generation of predominantly older agricultural operators, what are the privacy and data-sharing vulnerabilities/challenges that cut across societal, business, and legal areas?</i>	A better understanding of the vulnerabilities of Ontario's farming operations because of data breaches or access to proprietary information will enable the stronger protection of our food system.	A stronger understanding and a quantification of risks of Ontario's farming operations due to vulnerabilities from data sharing arrangements or privacy breaches.	2021.024

APPENDIX: OMAFRA Research Questions

Research Focus Areas	Question	Rationale for Research and Benefit	Outcomes and Deliverables	RIB ID
Innovative and Disruptive Technologies and Practices	<i>What new automation tools and techniques can be developed to improve production efficiency and reduce energy, labour, and pesticide use, and improve plant health decision-making and pest detection in greenhouse, warehouse, and vertical farm production of edibles (vegetables and fruits), ornamentals (flowers, landscape), and cannabis? (e.g., autonomous growing, sensor technology for climate and irrigation, packaging alternatives, vision systems and scouting software for integrated pest management (IPM), etc.)</i>	Greenhouse, warehouse, and vertical farm production is intensive, and often integrates tools and technology to make it more efficient. Technology that can improve production, energy or labour efficiency is needed to keep the sector competitive in domestic and international markets. On farm diagnostic tools and techniques are needed to improve the effectiveness of IPM programs. More efficient IPM will improve pest detection and control outcomes (e.g., finding pests at lower levels, using fewer biocontrol agents/pesticides due to earlier detection). The sector is a strong adapter to emerging technology, and options for greenhouses, warehouses and vertical farms of all crops and sizes continue to be in demand. Creating technology options in Ontario also has the added benefit of increasing the local support sector for Ontario producers.	Cost-effective and innovative technologies that improve labour, energy, production, and pesticide efficiency. Outcomes would include efficiency/savings reports highlighting improvements to pest detection and outcomes; reports of reduced pesticide use due to better management and planning of IPM programs through data analysis; best management practices (BMPs) on how automation best fits into a system wide IPM program. Technologies would have a commercialization potential to benefit the sector.	2020.050
New Product Development	<i>How can research support the commercialization and development of novel livestock species (including aquatic animals)? (e.g., identify dietary requirements, quantify the effects of rearing temperature on growth performance and compare performance between native populations of lake whitefish).</i>	Novel livestock species provide opportunity to access emerging and under serviced markets however the development of new livestock species requires research to inform the commercialization process. Research can address areas of species development for new livestock species (including aquatic animals) that hinder the commercialization process and facilitate the development of new livestock commodities.	Research outcomes could include Identification of optimal dietary formulation, tools to enhance brood stock development, quantifying the affects of rearing conditions on productivity and identification of native species populations (e.g., lake whitefish) which perform optimally agricultural conditions.	2023.016
New Product Development	<i>How can next-generation, sustainable, and biodegradable plastic alternatives be developed with superior properties to assure food safety along the supply chain?</i>	An acceptable and good replacement of single-use plastics for food packaging applications needs to fulfil the criteria of (i) having a flexible design to cater to a variety of foodstuffs (dry powders or solids, liquids, emulsions etc.), and (ii) harboring superior properties such as antimicrobial, antioxidant, heat and thermal resistant, radioprotective etc. – which would assure food safety along various steps of the supply chain.	The research outcomes will demonstrate forward-looking biotechnologies for plastic packaging alternatives and assuring food safety by virtue of the advanced material properties and biodegradable. Demonstrates the cost competitiveness of sustainable versus conventional packaging	2023.003

APPENDIX: OMAFRA Research Questions

		Understanding the dynamics of mycelium growth and its modification to obtain design flexibility and tailored properties is important, however information is lacking.	products for potential significant market share.	
New Product Development	<p><i>How can value-addition of agricultural biomass crops, crop residues and other lignin by-products from agricultural crops and food sector be integrated with innovative, smart and carbon-neutral fungi-based technologies to produce advanced packaging materials for the food industry?</i></p> <p><i>***Note: Proposals must include a Value Assessment Plan</i></p>	The environmental policy in Canada has prompted the converting industry to explore alternatives to single use plastics (SUP) for the production of food packages and containers. Single-use plastic food packaging has been highly valued in the food industry as it has facilitated food distribution and preservation, and reduced food wastes. However, its use poses enormous environmental burden both due to its fossil-fuel derived manufacturing as well as limited environmentally sustainable end-of-life options (reuse and recycle). There is an urgent need to develop alternatives to single-use plastics. Notably, there is a renewed interest to utilize cellulose fiber-based substrates. A smart carbon-neutral, and advanced material alternative which has gained huge momentum is fungal mycelium, a newer approach which are produced from agricultural residues. However, several aspects of bioprocessing technology to obtain such lignin and mycelium-based products with desired mechano-physical properties remain unclear	<p>Development of Innovative, zero carbon technologies based on fungal biotechnology for advanced, biodegradable and sustainable packaging materials for food industry.</p> <p>Understanding of feedstock properties and mycelium growth characteristics for scalable and industry adoptable mycelium production.</p> <p>Development of cellulose fibre lignin coating formulations suitable for packaging applications, substituting per- and polyfluoroalkyl substances (PFAS) chemicals currently used.</p> <p>Effective research and innovation system to satisfy Made-in-Ontario Environmental Plan to mitigate plastic pollution</p> <p>Research outcomes will demonstrate robust uptake of bio-sourced and next-generation smart packaging materials.</p>	2023.002
New Product Development	<p><i>How can livestock (equine, poultry, swine, ruminant and aquatic species) manure be developed into usable products to support sustainability of the sector e.g., renewable energy source, medium for production of antimicrobial</i></p>	Many facilities pay people to haul manure off the farm. Manure management is a large part of livestock production. For example, on average, a 1000 lb horse produces 50 lbs of manure/day. In other countries, horse manure has been used as a renewable energy source (horse manure bricks) and as a medium to grow	An understanding of how livestock manure can be developed into sustainable products and support the growth of rural communities.	2022.013

APPENDIX: OMAFRA Research Questions

Research Focus Areas	Question	Rationale for Research and Benefit	Outcomes and Deliverables	RIB ID
	<p><i>from fungus, compost for sale etc? What would be the economic feasibility and environmental impact of such products sold commercially? What are the potential barriers to market for products?</i></p> <p>Note: Proposals must include a Value Assessment Plan.</p>	<p>fungus that produces an antimicrobial for use in food preservation (copsin). The feasibility of developing these or similar products in Canada have not been pursued for many species. There is potential for livestock producers/custodians to economically benefit from manure.</p>		
New Product Development	<p><i>How can biomass crops (miscanthus, switchgrass, big blue stem), hemp and other agricultural crop fibres be suitably used in the construction/ building materials and for potential carbon storage and GHG emission reduction?</i></p> <p>Note: Proposals must include a Value Assessment Plan.</p>	<p>There is lack of information regarding the chemical composition of the fibres and their compatibility and behaviour with cement building materials and for insulation. Engineering properties are required to be determined as per Ontario building code standards materials. Quantification on carbon storage and GHG emission reductions from building materials.</p>	<p>The desired outcome is to better understand on use of biomass and other agriculture fibres suitability for use in sustainable building materials. The research outcomes can demonstrate for robust uptake of bio-sourced and innovative construction materials.</p>	2022.007
New Product Development	<p><i>What products can be developed or refined to expand the use of the dairy ingredient known as solids-not-fat (SNF)?</i></p> <p>Note: Proposals must include a Value Assessment Plan.</p>	<p>One of the challenges in the sector is the disequilibrium in the marketplace for butterfat versus protein and other solids (SNF, for solids non-fat). Growth has been strong for dairy fat recently and that's outpaced growth for SNF. As a supply managed sector, there are export caps for what Canada can export in terms of skim milk powder etc., which has been an important outlet for SNF surpluses. That outlet shrunk with implementation of the latest CUSMA trade deal, so new uses for SNF would be a positive development.</p>	<p>The results of this research could provide new markets for SNF within Ontario and Canada.</p>	2021.043
New Product Development	<p><i>What are the processes to profitably develop value-added products for locally grown hops, including extracts for brewing and natural health products?</i></p>	<p>International hop markets are variable for raw products (e.g., leaf hops and pelletized hops). In the last 10 years, hop extracts have captured over 15% of all hop use in Canada at the expense of pelletized hops. Currently there are no known hop extracts being</p>	<p>Development of cost-effective resin extract processing facilities and the development of high quality, novel packaging for Ontario produced hop resins for brewers. Develop a better understanding of health-related uses</p>	2021.039

	Note: Proposals must include a Value Assessment Plan.	produced in Canada from Canadian grown hops. This growing opportunity could provide Ontario hop growers with new market opportunities to produce extracts from their raw product making it more shelf stable and increase quality and longevity of their products. Additionally, some Ontario growers are investigating the opportunity for hops in other ways including as natural health products. Further understanding of the value of hops for health purposes and the development of products for end users is needed.	for hops and shelf ready products/packaging for the consumer market.	

Trade, Market and Targeted Sector Growth Opportunities

Research Focus Areas	Question	Rationale for Research and Benefit	Outcomes and Deliverables	RIB ID
Domestic Market Analysis	<i>Equity deserving groups have been disproportionately impacted by food security and food sovereignty challenges both before and during the pandemic. What are the perceptions and expectations of consumers from equity deserving groups regarding ethically sourced/produced and processed food that addresses food sovereignty, food security, and social responsibility? Is the sector meeting those expectations? Is the food supply chain perceived as an inclusive, accessible sector? If not, how can those perceptions be addressed as the demographic profile of Ontario continues to become more diverse due to immigration? What inclusive</i>	Maintaining and enhancing public trust in the food supply chain is important including the provision of transparent responses to increased public interest in sustainable, socially responsible, culturally relevant, and ethical food practices. Understanding consumer demands of equity deserving groups and how the agri-food sector can respond to their demands will inform business supports targeted to sector recovery, diversity, and resiliency. It will also impact OMAFRA's design and delivery of supports and programming for international and domestic agri-food workers.	An accurate, in-depth snapshot of consumer demands and food security challenges of equity deserving groups will support OMAFRA's policy and program development. The results will provide a snapshot of challenges on which OMAFRA can design effective and targeted strategies to increase the access by those groups to the agri-food supply chain whether they are foodpreneurs, workers, and/or consumers. It will position OMAFRA as a vital partner in cultivating a diverse agri-food supply chain that includes all groups within Ontario's population.	2021.078

APPENDIX: OMAFRA Research Questions

Research Focus Areas	Question	Rationale for Research and Benefit	Outcomes and Deliverables	RIB ID
	<i>practices in food production and processing can be integrated into the supply chain to address their expectations? How can OMAFRA support those practices?</i>			
Domestic Market Analysis	<i>How can we gather and compile the data on existing supply and value chains and expand or create new market opportunities for specialty crops (e.g., ginseng, industrial crops, specialty fruit, specialty vegetables, specialty grains, tree nuts, herbs, hops) both domestically and internationally? (e.g., develop economic, trade, and marketing information).</i>	There is no or limited data for developing new supply chains, value-added products, and economies of scale for specialty crops. This information needs to be collected and/or adapted for use in creating new market opportunities for Ontario specialty crop products.	The collection and development of market and supply/value chain data and information will allow Ontario growers to identify those specialty crops that represent the best diversification opportunities.	2021.061
Global Market Analysis	<i>How has the COVID-19 pandemic affected consumer behaviour in Ontario's seven key international priority markets (i.e., the U.S., Mexico, Japan, China, U.K., Germany, the Netherlands) and how does that shift present opportunities for Ontario's agri-food exporters in the next 2-3 years?</i> <i>Preferred proposals should include one or more of the following:</i> <i>a. How has increased use of e-commerce impacted consumer purchasing?</i> <i>b. What are the evolving trends in e-commerce; and how are last mile,</i>	COVID-19 has dramatically affected the global food supply chain and altered consumer behaviour and purchasing trends. Ontario's agri-food exporters would greatly benefit from timely and relevant insights on the new landscape of exporting - both in terms of challenges and opportunities. Comparisons to the circumstances before the pandemic could help companies better adapt and adjust to the changes in the agri-food supply chain, which would contribute to Ontario's economic performance.	Obtain timely information in the form of a report or reports on how Ontario's agri-food exporters can adapt and best recover from the impacts of COVID-19 to inform strategic thinking and support for continued agri-food export growth. This research would align with ongoing ministry efforts to support trade advocacy, market diversification and market access.	2020.029

APPENDIX: OMAFRA Research Questions

Research Focus Areas	Question	Rationale for Research and Benefit	Outcomes and Deliverables	RIB ID
	<p><i>logistics and warehousing trends affecting e-commerce?</i></p> <p><i>c. What are the challenges and how can they be addressed?</i></p> <p><i>d. Proposals could focus on just one of the seven markets, or a combination of multiple markets among the seven.</i></p> <p><i>e. Proposals could consider regional demographics, purchasing power, packaging, and flavour preferences, etc. and should offer specific insights, strategies and information relating to identified platforms (e.g., practical approaches like e-commerce or curbside pick-up, etc.) that would help Ontario's value-added agri-food exporters develop their own exporting plans.</i></p> <p><i>The focus of the synthesis/research should be on value-added agri-food goods since most Ontario's agri-food exports are value-added products.</i></p>			
Global Market Analysis	<p><i>What are the international market opportunities (e.g., Asia) for specialty crops (e.g., ginseng) and what are the regulatory (e.g., CITES) and non-regulatory (e.g., pesticide residues) barriers/challenges with serving these markets?</i></p>	<p>Direct access to large international markets for Ontario crops and animal products (e.g., ginseng market in China) is impeded by numerous barriers (e.g., DDT and other pesticide residues, medications, paperwork required for CITES for tourist markets). Analysis of current challenges and opportunities and identification</p>	<p>Better understanding and evidence to expose barriers / challenges to accessing targeted markets for Ontario's crops and animal products.</p>	2019.092

APPENDIX: OMAFRA Research Questions

Research Focus Areas	Question	Rationale for Research and Benefit	Outcomes and Deliverables	RIB ID
Global Market Analysis	<p><i>COVID 19 impacts, changing consumer preferences and shifting consumer trends will create new regional opportunities in the U.S. for Ontario exporters. Among the secondary group of Ontario's U.S. state trading partners, which ones (i.e., Missouri, Kentucky, Tennessee, Indiana, West Virginia, Virginia, North Carolina, South Carolina), present the best opportunities for Ontario's agri-food sector to seek realistic success in the next 2-5 years?</i></p> <p><i>Preferred proposals will include one or more of the following:</i></p> <ul style="list-style-type: none"> <i>a. Which subsectors of Ontario's agri-food sector might be most compatible with each market's needs?</i> <i>b. What are the potential barriers to overcome, particularly in terms of logistical and transportation challenges?</i> <ul style="list-style-type: none"> <i>i. How can these barriers be addressed?</i> <p><i>Proposals could consider regional demographics, purchasing power, head office locations, predilections to try new foods, private label-focused retailers, or</i></p>	<p>of mitigation options could support the growth of new markets for Ontario agri-food products.</p> <p>The long-term trend holds that the U.S. is the largest and most important export market for Ontario's agri-food sector: in 2021, 96% of Ontario's agri-food exports to the U.S. were value-added exports. Ontario's top U.S. trading partners are concentrated in the Northeast and Mid-Western regions of the country, in addition to Florida, Georgia, Texas and California. Highly integrated and well-established north-south supply chains facilitate this ongoing, mutually beneficial two-way trading relationship. While Ontario has much success in the U.S., the full potential of the market is far from being realized. In 2021, U.S. global agri-food imports totalled \$212.9B USD (\$266.7B CAD). With Ontario's -wide variety of agri- food exports to the U.S. totalling \$15.6 billion CAD, the ON market share of the domestic U.S. agri-food market is less than 6%. Ontario food manufacturers have ample opportunity to work with retail and food service buyers beyond the Northeastern and Mid-West regions. Ontario could likely seek significant growth in the Southern states, to fill the gap between Ohio and Florida starting with the retail channel. Not enough is currently known about the opportunities that Ontario could maximize and the existing challenges to that success in the secondary U.S. states that Ontario trades with, beyond its top trading partners.</p>	Obtain a better understanding of the challenges and growth opportunities for Ontario's agri-food sector beyond it's top trading partners to then inform a strategic approach to guide key agri-food sectors to take actively pursue growth in key channels in those markets. Ultimately, this research would help answer the question if this avenue of market diversification should be a priority for OMAFRA.	2019.080

APPENDIX: OMAFRA Research Questions

Research Focus Areas	Question	Rationale for Research and Benefit	Outcomes and Deliverables	RIB ID
	<i>proximity to major transportation hubs, or any combination of such factors.</i>			
Targeted Sector Growth	<i>What are the most promising economic end use market opportunities for biomass crops (switchgrass, miscanthus), hemp, crop and food processing residues and by-products and for potential industrial bioproducts manufacture and value chains in Ontario?</i>	There is increasing interest in transitioning away from petroleum-based products and processes. The demand for increased plant-based products is expected to drive new economic opportunities for purpose grown feedstocks and biomass, organic residues/food wastes and other bio-based by-products. For example, Michelin plans to reduce its industrial carbon footprint by 5% to 25 % and Lego launched a range of plant-based plastic toys in 2018. Other companies/retail stores in the value chain, such as IKEA, Lego, Danone, Walmart, and Nestlé are incorporating policies for reducing fossil-based products and processes with those that are bio-based. There is potential use of biomass and hemp in buildings and construction industry. Understanding these new market opportunities from using biomass crops, hemp and agricultural feedstocks is important as information is lacking.	This research results will provide evidence to support <ol style="list-style-type: none"> 1. growth of the agri-food sector in Ontario, 2. expansion of acreage of biomass crops and hemp in Ontario, 3. new market applications for biomass crops and hemp, 4. use of advanced materials and industrial bioproducts manufacture from biomass crop feedstocks and 5. new feedstock supply chains and integrated bioproduct value chains which best fits for Ontario. 	2019.093

Strong Rural Communities

Innovative and Disruptive Technologies and Practices	<i>What types of northern fruit tree varieties (i.e., apples, pears), vegetables and cold climate nuts are available in western provinces (i.e., Manitoba) and elsewhere that can be adopted in Northern or near-northern Ontario regions? Where can seeds be sourced from?</i>	Meta-analysis of northern fruit, vegetables and nut varieties that can be adopted to Northern Ontario	A report back on northern fruit, vegetables and nut tree varieties that can be recommended for northern Ontario regions.	2022.025

APPENDIX: OMAFRA Research Questions

Research Focus Areas	Question	Rationale for Research and Benefit	Outcomes and Deliverables	RIB ID
Labour Access/Efficiencies	<p><i>How prepared and what tools are available to support farmers in understanding the workplace accommodation needs of international agricultural workers as well as Indigenous, Black, and Racialized communities? As OMAFRA moves towards a zero-tolerance culture to racism and discriminations, how can the ministry support farmers and the agri-food sector with Equity, Diversity, and Inclusion, promote growth of the sector and retain international agricultural workers as well as Indigenous, Black, and Racialized communities?</i></p>	<p>Staff have reported incidents of racism and harassments at regulated clients and partners work locations. There are potentials for international agricultural workers as well as Indigenous, Black, and Racialized communities are or will face similar issues. Part of OPS response to the Third-Party Review and OMAFRA’s Anti-Racism Action Plan include applying Equity, Diversity and Inclusion lens to policies and programs.</p>	<p>An increased understanding of farmers preparedness in understanding accommodation needs of international workers. Determine the level of support required to assist farmers in fulfilling the ministry’s zero tolerance culture to racism, discrimination, and harassment.</p>	2022.006
Labour Access/Efficiencies	<p><i>As unmet labour demands increase, what are the labour motivations as well as business and management/business owner impacts resulting from changes in labour compensation?</i></p> <p><i>Preferred proposals will include a holistic assessment of the business and employer impact of significant increases in labour total compensation (this includes regionally competitive wages, health/dental benefits, pension/RRSP, etc.) and will include elements of the following:</i></p> <p><i>Business impacts to consider include, but are not limited to:</i></p>	<p>It is well known that the agri-food sector (primary production and processing) is chronically plagued by labour challenges and shortages. A large focus towards addressing these challenges have recently focused on sector skills development as well as industry marketing efforts.</p> <p>It is also well known that the agri-food sector predominantly offers lower wages and struggles to compete with other sectors offering more attractive employee compensation – regionally and provincially.</p> <p>The ministry needs to understand to what effect/impact compensation (including wages, health/dental benefits, pension/RRSP, etc.) has on attracting, retaining, and motivating farm and processing labour. Comprehensive impacts on the business and business owner(s)/manager(s) needs to be understood, beyond</p>	<p>The desired outcomes include the identification of business and business owner(s)/manager(s) impacts directly related to significant increases in labour compensation.</p> <p>Various KTT products could be developed and shared; including an extensive report (help inform government and industry/sector association policy) as well as a summarizing PowerPoint to be used in stakeholder as well as industry business communication. Results could inform policy and program development and design respectively, to help support the attracting, retention, and productivity of sector labour. Results should be disseminated to relevant sector participants and individual businesses.</p>	2022.001

APPENDIX: OMAFRA Research Questions

Research Focus Areas	Question	Rationale for Research and Benefit	Outcomes and Deliverables	RIB ID
	<p>a. Productivity b. Operating costs (labour) c. Turnover costs (training, recruitment, etc.) d. Opportunity capitalization</p> <p>Employer impacts: a. Mental health indicators – stress, etc. b. Physical health c. Work/life balance – business owner/manager ability to take time off, etc.</p>	<p>the initial increased labour costs due to compensation increases.</p>	<p>Future research/projects could involve implementing these changes, if results are positive, in case-studies (using key influential people/business owners, etc.). An outcome of this research could involve suggestions for research outcome industry adoption.</p>	
<p>Labour Access/Efficiencies</p>	<p>What are the areas in which innovation and technology cannot replace human labour in the agri-food sector, including specific tasks and skills on the farm and in food processing plants, retail, and distribution? Which sectors will remain highly reliant on human capital? Which sectors will have human capital be replaced by automation?</p>	<p>An understanding of the agri-food sectors in which labour disruption is not anticipated will help inform labour policy and program initiatives and business supports. Having accurate data about the current and projected technology disruptions across the agri-food sector will enable strategic planning and program investments to support businesses in a timely and effective manner.</p>	<p>Identification of agri-food subsectors where skills may be more in demand to support approaches to ensuring a skilled workforce is in place. Results would inform policy and program development and design respectively, to help support the development and/or maintaining of an appropriately skilled workforce.</p>	<p>2021.079</p>
<p>Labour Access/Efficiencies</p>	<p>What pathways are currently available to funnel job seekers into the Agri-food and food processing sectors? What are the gaps in recruitment?</p> <p>Preferred proposals will include some or all the following considerations: a. How has COVID-19 impacted recruitment and retention? b. Are there effective pathways into the frontline jobs in agri-food?</p>	<p>It is important to understand current pathways into the sector and how those can be expanded and strengthened to encourage larger numbers of workers to fill job gaps and to replace aging workforce. By identifying new employment and training partners, they can assist the sector to provide more recruitment pathways through short-term, job-specific micro-credential programs. The proposed research will directly benefit agri-food businesses as well as job seekers who may not have considered the sector as a career path. It will document effective strategies and</p>	<p>An assessment of pathways (existing and potential ones) to funnel job seekers into the Agri-food and processing sectors will help to target funding and supports to employers within agri-food that are in most need of workers. The desired outcomes will include materials and activities that increase understanding with respect to the role of existing programs and supports and will identify gaps and opportunities for new pathways. At an individual job seeker level,</p>	<p>2021.076</p>

APPENDIX: OMAFRA Research Questions

Research Focus Areas	Question	Rationale for Research and Benefit	Outcomes and Deliverables	RIB ID
	<p><i>E.g., occupation specific recruitment such as harvesting workers, meat cutters, etc.</i></p> <p>c. How can employment, education, and training partners provide new multiple pathways into agri-food?</p> <p>d. How can we leverage stakeholder partnerships, other ministries, and levels of government to help the sector meet projected job vacancies?</p>	<p>potential partnerships between training institutions and employers. It will provide information to leverage other government programs such as MLTSD Employment Ontario programs that support employers with worker recruitment, job placements and employer incentives.</p>	<p>the project will include elements that will increase efficiency of training and recruitment pathways to access long-term employment in the sector as well as potential internal promotions. Results will inform further policy and future program development within OMAFRA.</p>	
<p>Labour Access/Efficiencies</p>	<p>How can the ministry support the development of a skilled pool of job seekers that will enable agri-food businesses to expand and produce?</p> <p>Preferred proposals will include some or all the following considerations:</p> <p>a. A skill-needs profile of the agri-food workforce in the short and long-term.</p> <p>b. What are the levels of education, skills and knowledge required for agri-food occupations that are most in need?</p> <p>c. Are jobs in agri-food actually “unskilled” or “low skilled” as is often the description of frontline agri-food occupations?</p> <p>d. What are the working conditions for frontline agri-food workers?</p> <p>e. Which incentives and remuneration support attraction,</p>	<p>A comprehensive report on labour engagement and utilization will support the sector to focus on effective strategies based on current sector intelligence. Identification of labour recruitment and training pathways will help businesses to meet immediate and future labour needs. Utilizing this research along with labour demand reports from the agri-food sector organizations including existing skills matrices, will enable a coordinated cycle of labour management to ensure food supply stability and decreased business risks due to lack of suitable workers.</p>	<p>A detailed, formal labour force research study, including job task analysis, key informant interviews, and documentation of working conditions conducted by an objective third-party, will provide detailed intelligence upon which the sector and the ministry can plan strategies. The report should identify workforce skill gaps and identify opportunities for new occupation-specific training programs. The research will identify agri-food subsectors where skills may be more in demand or where skill levels are increasing due to the integration of technology. The labour study report should provide baseline data and recommended measures that can be used to coordinate comprehensive labour force management over the long-term.</p>	<p>2021.075</p>

APPENDIX: OMAFRA Research Questions

Research Focus Areas	Question	Rationale for Research and Benefit	Outcomes and Deliverables	RIB ID
	<p><i>retention, and promotion of workers from job entry to skilled worker or supervisor?</i></p> <p><i>f. How has the COVID-19 pandemic impacted working conditions?</i></p>			
Labour Access/Efficiencies	<p><i>As unmet labour demands increase, the need to understand new labour motivations increases.</i></p> <p><i>What attracts equity deserving groups (e.g., BIPOC, PWD, women, low income, job precarious etc.) into the agri-food sector and supports their retention? And what are the barriers and risks that these populations face with respect to entering and advancing the in agri-food workforce (farm, food processing, distribution, and retail)?</i></p> <p><i>Preferred proposals will include one or more of the following:</i></p> <ul style="list-style-type: none"> <i>a. What best practices exist to address these risks and barriers?</i> <i>b. How are other jurisdictions approaching diversity and inclusion in their agri-food sectors?</i> <i>c. What are the key challenges for equity deserving groups to access, examples urban farming, rural communities, food entrepreneurship?</i> 	<p>Equity deserving groups could help address the labour gaps in the agri-food sector. The ministry needs to determine which government levers (policies and programs) currently exist that support the attraction and retention of these groups. Issues of appropriately skilled workers and adequate numbers of workers were pre-existing challenges that became more visible during the COVID-19 pandemic. Understanding the motivations and strategies to attract and retain equity deserving groups as well as the risks and barriers to their participation in agri-food will allow Ontario to better support the agri-food sector and ensure healthy and safe work environments. Projections of job vacancies by agri-food sector groups confirm that immediate and long-term strategies are necessary to maintain supply chain stability and enhance productivity.</p>	<p>A comprehensive report on risks, barriers, and motivations will support employers within agri-food that are in most need of workers. The research will positively contribute to increasing the capacity and production levels of agri-food businesses. Project results will inform ministry policy and program development. Research into models used in other similar jurisdictions will inform the ministry about successful, best practices. The report will include recommendations for programming, projects, and policy development. It will provide insights into engaging equity deserving groups into the agri-food labour pool.</p>	2020.027

APPENDIX: OMAFRA Research Questions

Research Focus Areas	Question	Rationale for Research and Benefit	Outcomes and Deliverables	RIB ID
	<p><i>d. How can succession planning be leveraged to increase access by equity deserving groups to the agri-food sector?</i></p>			
<p>Labour Access/Efficiencies</p>	<p><i>If pandemic responses, availability of international agri-food workers (IAWs) and possible accelerated increase of automated operations increase the need for skilled and technical workers due to the increased role technology plays in agri-food workplaces; what are the skills that will be required within the workforce (e.g., programmers, developers, data analysts, equipment technicians, and tech operators), to maximize technologies’ potential to support the sector and increase productivity?</i></p> <p><i>Preferred proposals will include one or more elements of the following:</i></p> <ul style="list-style-type: none"> <i>a. Are these skills more in demand in certain sub-sectors and are they suitably prepared?</i> <i>b. If these skills are not available, what is the recommended approach for developing a workforce that has the required skillset?</i> <i>c. Are there any barriers/challenges for ensuring that the appropriate level of skill is available to utilize technology now and in the future?</i> 	<p>Technology is playing an ever-increasing role in agri-food. To ensure that its’ potential to help the sector is realized, Ontario must ensure it has an appropriately skilled workforce to take full advantage of technology. Efficient adoption of technology in production and processing requires workers to possess specific technology-readiness skills, which may move international and domestic workers into higher wage levels. Understanding the job-specific skills and knowledge that workers must possess to utilize technology in the workplace will enable the ministry and the sector to develop a plan to fulfill those emerging jobs including funding programs for training, policy development and incentives.</p>	<p>The desired outcomes include - identification of agri-food subsectors where skills may be more in demand, recommended approaches to ensuring a skilled workforce is in place and the identification of barriers or challenges to developing this workforce. Job task analysis will provide information to more accurately assess the skill levels required for various agri-food occupations, which will positively impact job attraction and retention. The project results will inform future workforce and technology policy and program development. An appropriately skilled workforce is vital to increasing productivity and maintaining the stability of the food supply chain. Agri-food jobs are often labelled as no or low skilled. This project will investigate that claim by analyzing job tasks to develop informed job profiles, i.e., levels of skills and education required.</p>	<p>2020.026</p>

APPENDIX: OMAFRA Research Questions

Research Focus Areas	Question	Rationale for Research and Benefit	Outcomes and Deliverables	RIB ID
Multi-disciplinary collaborations to address complex needs	<p><i>Develop a research project to address key needs, challenges or emerging opportunities in support of Indigenous agriculture and food systems in Ontario.</i></p> <p><i>***Note: Proposals must clearly indicate the key needs, challenges or opportunities being addressed, and the communities and people who would benefit.</i></p>	<p>This contributes to OMAFRA's Indigenous Relations efforts and Action Plan is supporting the Ontario government's renewed commitment to strengthen relations, engagement, and partnerships with Indigenous communities, (e.g., Guelph Statement and diversity and inclusion aspects of the Ministry Outcome and Values Framework including the Alliance Agreement IEDI and Reconciliation Statement). It aligns with the diversity and inclusion strategic direction of ARIO.</p>	<p>Resulting outcomes will inform Indigenous agriculture and food systems solutions, innovations, products, and practices which address the challenges facing the sectors and capitalize on opportunities will enable Ontario's agri-food sector to be more competitive, productive, sustainable and resilient while protecting an efficient, reliable and responsive food supply.</p> <p>Teams should be equipped to consider impact(s) on equity and representativity of deserving groups.</p>	2023.012
Multi-disciplinary collaborations to address complex needs	<p><i>How can housing arrangements be improved to reflect the health and welfare needs of international agri-food workers (IAWs)?</i></p> <p><i>Preferred proposals will include some or all the following considerations:</i></p> <ul style="list-style-type: none"> <i>a. How can best practices from other jurisdictions be adapted for housing for international agri-food workers in Ontario?</i> <i>b. What are the most supportive approaches to helping farmers to ensure housing equity?</i> <i>c. How do housing arrangements affect IAWs' health, both physical and mental?</i> <i>d. IAWs are essential to the stability and potential growth of the agri-</i> 	<p>There are several challenges with biosecurity, social interactions, and environmental quality within different IAW housing options. The current availability and quality of housing options needs be assessed to develop a new framework that supports worker health and welfare and quality of life. Housing conditions should be consistent across the province. The pandemic highlighted pre-existing housing conditions that needed to be addressed from a health & safety perspective. Housing is one of the key factors of worker retention and safety, so the sector must be empowered to provide conducive environments. A housing framework will provide supportive strategies to the sector. Further, it will provide a foundation for future policy and programming targeted to housing policy and standards. Employers will benefit from consistent housing expectations and guidance on best practices from government. The stabilizing effect of quality housing on workers will support their health, safety, and retention.</p>	<p>Outcomes will include knowledge regarding current housing systems and management practices, options for improved housing arrangements that support optimal health and welfare conditions for IAWs.</p>	2021.083

APPENDIX: OMAFRA Research Questions

		<p>raise property taxes to cover the gap resulting from the railway company's share of drainage costs.</p> <ul style="list-style-type: none"> Knowing the potential costs of drainage and maintenance relating to federal rail lines would help OMAFRA plan for this possibility. 		
Rural Community Development	<i>What is the interest in access, by either producers or processors, in mobile abattoirs across Ontario, and in particular Northern Ontario? What challenges have other jurisdictions faced (e.g., Alberta, BC, US) when it comes to inspection and overall food safety that would be pertinent to Ontario?</i>	Currently in Ontario, livestock processed using mobile abattoirs can only be returned to the producer for personal consumption. Other jurisdictions (US, Alberta) have developed systems utilizing mobile abattoirs to bring slaughter services to the farm. Accessibility to processing services, particularly in remote and northern communities is a long-standing industry challenge. Therefore, developing an inspection model that can support mobile abattoirs would address service availability challenges.	<p>Enabling mobile abattoirs may:</p> <ul style="list-style-type: none"> improve animal welfare by eliminating stress of transportation and minimize losses (e.g., dead on arrivals). Reduce environmental footprint caused by long distance transportation Provide new and innovative market opportunities for producers, butchers, and meat processors to expand their business Increase slaughter capacity and access to slaughter services – particularly for remote communities Encourage local markets while supporting Ontario producers Offer strong alignment with One Health objectives 	2022.026
Rural Community Development	<i>What are suitable business, funding and financing models for small and medium scale Indigenous agri-food farms, aquaculture, and businesses to support start-ups, improvements to existing businesses and expansions)?</i>	Indigenous participation in Ontario's agri-food economy faces historical and ongoing barriers due to the lack of scale-appropriate financial and business supports. As a result, Indigenous entry into the modern agri-food economy faces considerable barriers.	Micro- farms, micro-financing, collective purchasing, social enterprise, band and tribal council ownership, alternative forms of equity and private sector partnerships and community-based agriculture are among the models that could be applied to support increased Indigenous participation in Ontario's agri-food economy.	2022.009
Rural Community Development	<i>What are the structural (infrastructure, transportation, policy, lack of</i>	Indigenous partners continue to indicate that multiple structural factors are preventing their participation in the	This research can contribute to improved understanding of the barriers to Indigenous	2021.074

APPENDIX: OMAFRA Research Questions

Research Focus Areas	Question	Rationale for Research and Benefit	Outcomes and Deliverables	RIB ID
	<i>investment, scalability, etc.) barriers, drivers, and opportunities that limiting or support the development and/or expansion of Indigenous participation the agri-food economy?</i>	agri-food economy thereby limiting their economic development and exacerbating food insecurity, especially in Northern and remote communities.	agri-food economic development and the development of novel strategies and approaches to address them.	
Rural Community Development	<i>COVID-19 has highlighted the ongoing food insecurity challenges faced by Indigenous communities. While barriers to overcoming food insecurity are well known, an integrated Indigenous food security strategy for Ontario is needed. What are the elements of an integrated Indigenous food security strategy that can be adopted, locally, regionally, and provincially?</i>	Food insecurity, lack of access to affordable healthy food and lack of food sovereignty in Indigenous communities, particularly in northern and remote communities, is a well-recognized issue of concern with multiple contributing factors that require collaborative problem-solving approaches. Interdisciplinary research focused on, but not limited to, infrastructure, economics, technology, agronomy, policy, and human health are needed to meaningfully address this chronic challenge facing Ontario's Indigenous communities.	This research can provide insights into shaping an integrated Indigenous food security strategy that have many benefits including proving access to healthy food in Indigenous communities including improved health, increased economic development opportunities in food production, processing, niche market development and new transport technologies, community resilience and capacity.	2021.073
Rural Community Development	<i>What factors or barriers are hindering a stronger economic recovery in rural Ontario from the COVID-19 pandemic?</i>	The COVID-19 pandemic is having differing impacts on different industries and locations across Ontario. This research will help us better understand the economic recovery laggards including the potential barriers that may be limiting their recovery.	A better understanding of which industries and rural areas have been most impacted by the pandemic including potential reasons preventing a full economic recovery will be the outcome of this research.	2021.070
Rural Community Development	<i>What is the cost benefit analysis of green infrastructure as an asset in rural and peri-urban water management systems? How would watershed management benefit from the incorporation of built green infrastructure as an asset within rural and peri-urban drainage infrastructure? What are the costs and benefits?</i>	Although significant research has been done in the urban context in the U.S. and some limited research has occurred in Canada, much less is known about green infrastructure in the rural context. Green infrastructure is considered an emerging practice that is believed to have the potential to improve water quality, manage water to prevent flooding downstream, provide storage for times of drought, increase biodiversity, and maintain agricultural productivity. The sector requires an understanding of the costs and benefits associated with incorporating green infrastructure into Ontario's rural/agricultural drainage	Regionally specific financial/economic analysis and case studies of rural and peri-urban drainage infrastructure that consider the impact of green infrastructure on agricultural productivity and flood protection. A clear business case is developed that identifies the costs and benefits of green infrastructure. In peri-urban, or non-farm contexts, this project would also assess the economic considerations for municipalities of utilizing the Drainage Act for implementing green infrastructure. The outcome would be research that that would	2020.090

APPENDIX: OMAFRA Research Questions

Research Focus Areas	Question	Rationale for Research and Benefit	Outcomes and Deliverables	RIB ID
		<p>systems. Further, there is a knowledge gap on how the Drainage Act can be leveraged in urban settings to support green infrastructure.</p>	<p>inform decisions regarding the need for private and public investment and how any future policies and programs might be structured and implemented. An economic analysis is required to support commitments in the (draft) revised COA 2020 to promote eligible investments, including investments in green infrastructure, that support the reduction of excess nutrients from non-point sources such as urban and rural stormwater (including stormwater from agricultural landscapes), as priority considerations under applicable infrastructure and other funding programs as well as commitments to build infrastructure resiliency and avoid wetland loss in the Ontario Flooding Strategy 2020. Risk of not proceeding is failure to leverage green infrastructure funding for rural drainage and to support watershed scale flood management.</p>
