

Tariff vs non-tariff barriers in seafood trade

Kathy Baylis, Lia Nogueira and Kathryn Pace

CATPRN workshop,

Toronto, May 28, 2011

Objective

To explore the effect and the cause of non-tariff barriers

- I) Do non-tariff barriers affect trade?
- II) What is the relationship between tariff and non-tariff barriers?

Are non-tariff barriers being used as a substitute for tariffs?

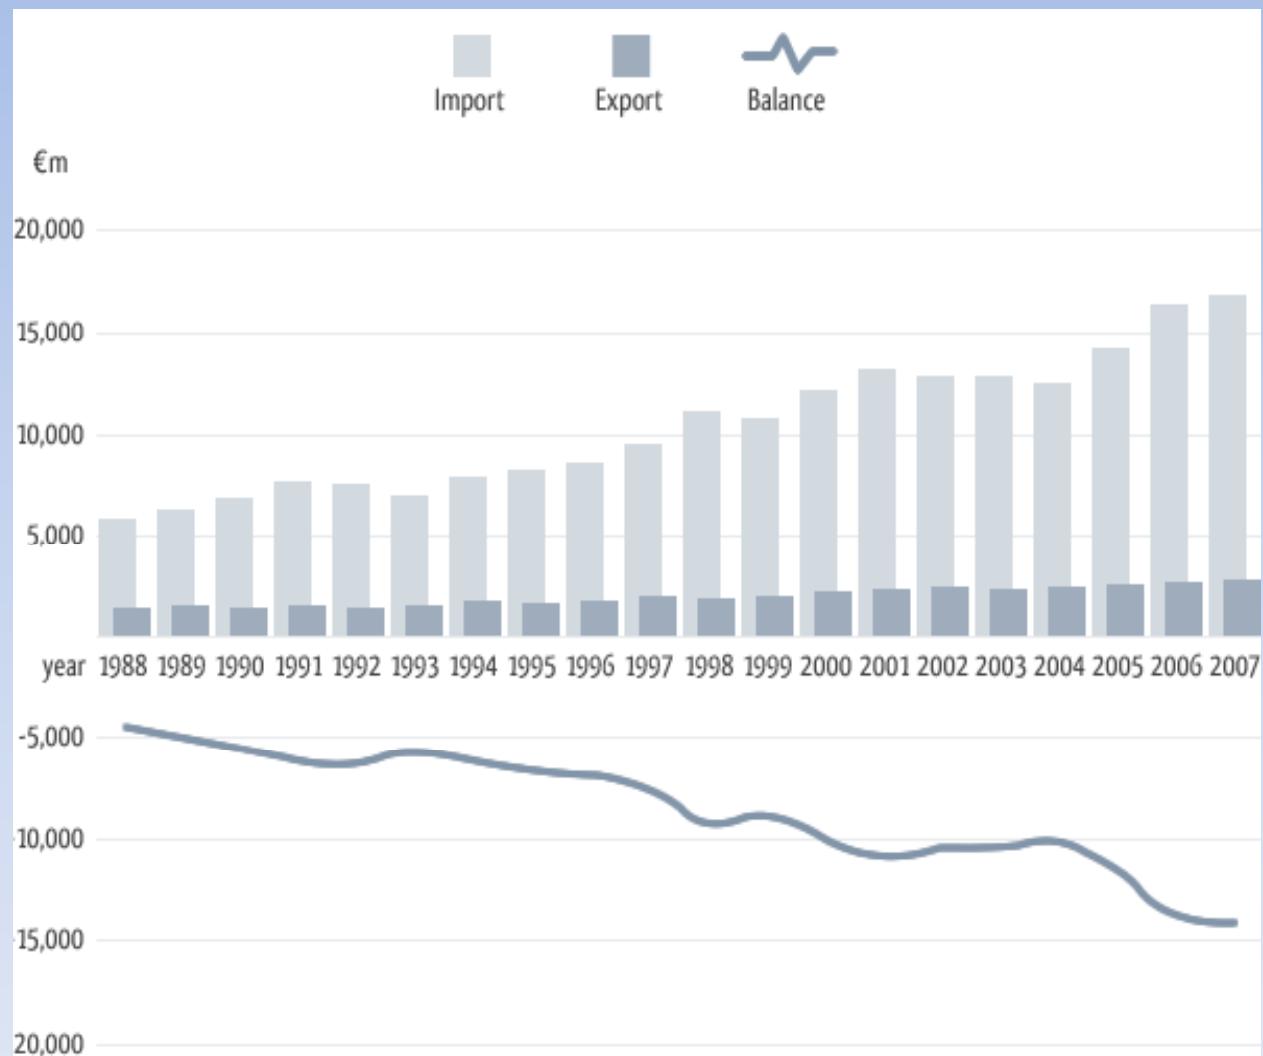

Some past work on non-tariff barriers in ag

- Calculation and use of non-tariff barriers
 - Beghin and Bureau (2001)
- Standards as barriers versus catalysts
 - Blandford and Fulponi (1999)
 - Swann et al. (1996)
 - Anders and Caswell (2009)
 - Debaere (2005)
- Import refusals
 - Grant and Anders (2010); Baylis, Nogueira and Pace (2010)

Few papers look at empirical interaction of tariff and non-tariff barriers

Why seafood?

- 1988: EU imported €5 billion of seafood
- Grew to €16 billion 10 years later
- The EU is currently one of the largest seafood importers in the world
- Seafood is the most rejected product in the EU

Rapid Alert System for Food and Feed (RASFF)

- Two Types of Notifications:
 1. Market
 2. Rejection
- Two Types of Market Notifications
 1. Alert
 2. Information
- In 2008, product category with largest percentage of alerts was seafood

Data

- Annual, 1998 to 2008
- Non-tariff barriers: EU seafood import notifications, coded at 6-digit HS level: (N=4,151) (*European Commission*)
- Global bilateral trade flows: 6-digit HS code (*United Nations COMTRADE database*)
- Tariff rates (WTO Tariff Analysis Online)

Data “issues”

No quantity of ‘notified’ shipments

Descriptions, not HS codes in RASFF

Tariff data is spotty

Methods I: Modified Gravity Model

(aka a good time to refresh your coffee)

$$\text{InValue}_{ijt} = \alpha_0 + \alpha_1 \text{totEUref}_{jt} + \alpha_2 \text{InValue}_{ijt-1} + \alpha_3 \text{Tot Exports}_{ijt-1} + \alpha_4 \text{lnGDP}_{ijt} + \alpha_5 \text{ExRate}_{ijt} + \alpha_6 \text{ComLanguage}_{ij} + \alpha_7 \text{lnDistance}_{ij} + \alpha_8 \text{Border}_{ij} + \varepsilon_{ijt}$$

i=importer, j=exporter, t=year

- Estimation: random effects and country fixed effects GLS
- Refusals and lagged trade value may be **endogenous**:
 - Use number of refusals from other exporters in same geographic region of same product in same year.
 - Use second lag of value to instrument for lagged value.
- Only consider exporters x product that have at least one refusal during our period ($N \cong 207,000$)

Results I: Trade Deflection – InValue of trade

Importer in EU		
Variable	Coefficient	St. Error
totEUref _j	-42.49***	11.21
InValue _{ij,t-1}	0.08***	0.003
Tot Exports _{ij,t-1}	2.58***	0.73
lnGDP _{ij}	10.73***	1.62
ExRate _{ij}	15.20	12.49
ComLanguage _{ij}	2.93	2.20
lnDistance _{ij}	-4.68**	2.38
Border _{ij}	3.96	4.84

Note: asterisks indicate levels of significance: *** = 1%, **=5%, *=10%

Results I: Trade Deflection – InValue of trade

Variable	Importer in EU		Importer not in EU	
	Coefficient	St. Error	Coefficient	St. Error
totEUref _j	-42.49***	11.21	3.11***	0.76
InValue _{ij,t-1}	0.08***	0.003	0.11***	0.003
Tot Exports _{ij,t-1}	2.58***	0.73	1.70***	0.37
lnGDP _{ij}	10.73***	1.62	3.79***	1.34
ExRate _{ij}	15.20	12.49	-0.09*	0.05
ComLanguage _{ij}	2.93	2.20	2.20***	0.85
lnDistance _{ij}	-4.68**	2.38	-1.75***	0.39
Border _{ij}	3.96	4.84	3.40***	1.13

Note: asterisks indicate levels of significance: *** = 1%, **=5%, *=10%

Results I Summary

- So EU seafood refusals:
 - Decrease exports to the EU
 - + Increase exports to third countries
 - Standard effect of Gravity Model Variables:
 - + Product of GDP, common language, shared border
 - Distance, devalued import currency
- ➔ NTBs clearly affect trade patterns.
Are they being used to protect domestic interests?

Methods II: Count model

Count of Notifications (HS6(h) x importer(i) x exporter(j) x year(t))

$$P(\text{EU notification}) = \beta_0 + \beta_1(\text{Risk}) + \beta_2(\text{TradeProtection})$$

$$\text{Risk} = f(X_{jht}, Z_{jt}, D_{ij})$$

$$\text{Trade Protection} = f(T_{ijht}, X_{jht}, Z_{it})$$

X are product characteristics

Z are country characteristics

D is distance

T are tariff rates: possibly **endogenous**. Instrument using trade agreements

- Only consider imports into countries that are or become EU member states ($N \cong 470,368$)

Results II: Count of Notifications - Risk

(many slides with many small numbers)

Variables	Base Model		Importer FE

Marginal Effects

Variables	Base Model	Importer FE
Change Tariff (IV)	-0.018	-0.027
Importer Fish Production	0.078	0.095
Import Market Share	0.012	0.009
US Refusal	0.019	0.019
US Alert	0.021	0.021

Mean EU notification = 0.013

Robustness Tests

- IV current quantity with lagged quantity
- Dynamic model
- Importer, Exporter and product fixed effects
- Average versus maximum tariff rates
- Poisson model

Discussion

- Non-tariff barriers do deflect trade
- Evidence that notifications are associated with higher risk
- Evidence that notifications are correlated with higher demand for protection

Implications

(something fishy going on...)

- EU member states may be using non-tariff barriers as a protectionist mechanism (at least as a substitute for tariff barriers)
- WTO requirements for non-tariff barriers are not working as intended
- Need for measures to ensure legitimate **implementation** of standards?

Questions?
