Physics: MSc, PhD

The department of Physics, as part of Graduate Studies in Physics, University of Guelph, University of Waterloo and the Biophysics Interdepartmental Group (BIG), offers unique graduate opportunities in experimental and theoretical research. Our faculty members collaborate with exceptional research institutions including the Perimeter Institute, the Canadian Light Source, and TRIUMF.

www.gwp.on.ca

Program

We offer Master’s and Doctoral programs in the Physics and Biophysics streams. Master’s students can choose between a course-work (approximately three semesters) and research-based thesis (approximately six semesters) MSc. The PhD program requires the successful completion of a qualifying exam and the completion and defense of a research-based thesis.

Research Fields

- Astrophysics and Gravitation
- Atomic, Molecular and Optical Physics
- Biophysics
- Chemical Physics
- Industrial and Applied Physics
- Soft and Hard Condensed Matter Physics
- Subatomic Physics

Admission Requirements

For the MSc program, applicants require an honours BSc, with a minimum B average (75%) in past two years of study.

For the PhD program, applicants require an MSc in Physics.

Application Deadline:

Ongoing

Entry: Fall, Winter, Spring

Application Requirements

In addition to meeting the minimum admission requirements, applicants are required to submit:

- All post-secondary transcripts
- Three (3) academic references
- Supplementary information form
- Physics Subject GRE (for applicants who did not complete post-secondary education in Canada)
- English Language Proficiency (for applicants for whom English is not their first language)

ARE YOU INTERESTED IN:

- Quantum Mechanics?
- Statistical Mechanics?
- Electromagnetic Theory?

CAREER OPPORTUNITIES:

- Communications
- Education
- Energy
- Health Care

As a member on Prof. Ralf Gellert’s team, Scott works on the alpha X-ray spectrometer (APXS), an instrument mounted on the Curiosity rover’s robotic arm. Testing soil and rock samples, it looks for evidence of water and life on Mars!

Departmental Graduate Faculty with Research Areas

**EXPERIMENTAL**

**Leonid Brown** - Photobiology, Biospectroscopy, Structure/Function of Membrane Proteins, Bioenergetics, Ion Transport, Photosensory Transduction, Retinal-binding Proteins (rhodopsins)

**John Dutcher** - Nanobiomaterials; physics of soft materials, surfaces and interfaces; polymers and biopolymers at the nanoscale; polymer physics; viscoelasticity; bacterial biophysics; biopolymer nanoparticles; thin film instabilities; self-assembly and pattern formation

**Paul Garrett** - Nuclear physics, nuclear spectroscopy, gamma-ray, neutron, and charged-particle detection, nuclear instrumentation, nuclear reactions, beta-decay, collective and single-particle excitations in nuclei

**Ralf Gellert** - Mars Exploration, Geology of Mars, Habitability of Mars, Planetology, X-ray Spectroscopy, alpha particle spectroscopy, digital and analogue electronics, radiation damage, Mineralogy, data analysis

**De-Tong Jiang** - Condensed matter physics, Interface structure and function of electronic thin films of organic semiconductor and metal silicides, grazing-incidence X-ray scattering and spectroscopy techniques, arsenic speciation in environmental systems

**Vladimir Ladizhansky** - Solid-state NMR, computational and biophysical methods, synthesis and purification of peptides and proteins, light-driven bacterial proton pump proteorhodopsin, photosensory cyanobacterial rhodopsin

**Mike Massa** - Active matter, soft matter physics, phase transitions and confinement, physics education

**Dennis Mürcher** - Atomic nuclei with a large excess of neutrons, stellar nucleosynthesis, applications of physics in cancer treatment

**Joanne O’Meara** - X-ray fluorescence (XRF) systems, physics education

**Xiao-Rong Qin** - Structural properties of vacuum vapour-deposited thin films of organic small molecules, carrier transport and other exceptional properties of films for applications in organic electronics

**Carl Svensson** - Evolution of nuclear shell structure in rare isotopes, superallowed Fermi beta decays, isospin caused by Coulomb and charge-dependent forces in the nucleus

**Martin Williams** - Physics Education, modern classroom technologies, designing inquiry-based physics labs to improve undergraduate learning outcomes

**THEORETICAL**

**Liliana Caballero** - Theoretical nuclear astrophysics, heavy elements, the neutrino emission in core-collapse supernova and neutron star mergers, and bursts in accreting neutron stars

**Alexandros Gezerlis** - Quantum many-body theory, fermions, ultracold atomic gases, terrestrial nuclei, neutron stars, nuclear astrophysics

**Elisabeth Nicol** - Superconductivity and graphene-based materials

**Eric Poisson** - Gravitational physics, general relativity, black holes, compact objects, gravitational waves, self-force

**Robert Wickham** - Polymer physics, soft materials, nano-scale self-assembly, non-equilibrium statistical mechanics, bacterial biophysics, simulation

**Huan Yang** - Gravitational wave physics; astrophysics in the strong gravity regime; gravity-fluid correspondence and holographic theories
