

Graduate Student Opportunity in Epigenetics

A PhD/Msc graduate student position is immediately available in Yankulov laboratory. The successful candidate will work in the area of epigenetics. We use the yeast *S.cerevisiae* as a model organism to decipher the mechanisms of epigenetic inheritance, this is the transmission of information independently of the DNA sequence. In particular, we are focusing on the link between DNA replication, histone chaperones and chromosome telomeres. We are using a broad spectrum of molecular biology and yeast genetics techniques. The project is funded by NSERC.

Independent and self-motivated applicants with strong background in molecular biology/genetics/biochemistry are encouraged to apply. Past laboratory experience (undergraduate research projects, volunteering or similar) is highly desired.

Please forward an unofficial/official transcript and a CV. For more information about research projects please contact Dr. Yankulov directly.
